

Business Situation

Preliminary Estimates for the Second Quarter of 2003

ACCORDING to the “preliminary” estimates of the national income and product accounts (NIPAs), U.S. economic growth stepped up more in the second quarter of 2003 than had been indicated in the “advance” estimates released last month.

- Real gross domestic product (GDP) increased 3.1 percent, revised up from 2.4 percent in the advance estimate.¹
- Gross domestic purchases increased 4.2 percent, revised up from 3.8 percent in the advance estimate.

These revisions mainly reflected the incorporation of new and revised source data for consumer spending and foreign transactions, as described in the section “Revisions.”

Despite the larger-than-usual revision to GDP, the picture shown in the preliminary estimates is quite similar both in broad outline and in many details to that shown in the advance estimates. In both sets of estimates,

- The growth of GDP and gross domestic purchases stepped up considerably in the second quarter. In the first quarter, GDP had increased 1.4 percent, and gross domestic purchases had increased only 0.6 percent (table 1 and chart 1).
- Consumer spending and government spending contributed the most to second-quarter GDP growth (table 2).²
- Fixed investment increased, while inventory investment decreased.
- Imports and exports both subtracted from growth in the second quarter.
- Prices increased much less than in the first quarter.
- Real disposable personal income (DPI) accelerated.

1. Quarterly estimates in the NIPAs are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and annualized. “Real” estimates are in chained (1996) dollars, and price indexes are chain-type measures.

2. In this article, “consumer spending” is shorthand for the NIPA series “personal consumption expenditures,” and “government spending” is shorthand for “government consumption expenditures and gross investment.” “Inventory investment” is shorthand for “change in private inventories.”

This article was prepared by Daniel Larkins and Michelle D. Robinson.

According to the preliminary estimates,

- Consumer spending, led by purchases of motor vehicles, contributed 2.65 percentage points to second-quarter GDP growth. Government spending contributed 1.53 percentage points, as defense spending posted its biggest increase since the third quarter of 1951.
- Nonresidential fixed investment contributed 0.80 percentage point to growth, as both structures and equipment and software increased. Residential investment contributed 0.21 percentage point to growth, mainly on the strength of brokers’ commis-

Addendum: Final sales of domestic product	9,630.4	79.3	25.9	53.1	94.2	3.4	1.1	2.3	4.0

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates usually are not additive. Chained (1996) dollar levels and residuals, which measure the extent of nonadditivity in each table, are shown in NIPA tables 1.2, 1.4, and 1.6. Percent changes are calculated from unrounded data. Percent changes in major aggregates are shown in NIPA table S.1. (See “Selected NIPA Tables,” which begins on page D-2 in this issue.)

sions on house sales. In contrast, inventory investment swung from accumulation to liquidation, subtracting 0.87 percentage point from GDP growth.

- Imports increased, subtracting 1.09 percentage points from GDP growth, and exports decreased, subtracting 0.11 percentage point.
- The price index for gross domestic purchases increased only 0.2 percent in the second quarter after increasing 3.4 percent in the first.
- Real DPI increased 2.8 percent after increasing 2.1 percent.

The preliminary estimates for the second quarter also show the following:

- Final sales of domestic product—GDP less inventory investment—increased 4.0 percent, the biggest increase in a year and a half.
- The production of services increased much more than in the first quarter, and the production of

goods and of structures increased a little less than in the first quarter (table 3).

- Real motor vehicle output decreased somewhat more than in the first quarter, and final sales of computers increased about the same as in the first quarter.
- Personal saving as a percentage of current-dollar DPI decreased to 3.3 percent from 3.6 percent. The national saving rate—gross saving as a percentage of gross national product—decreased from 14.0 percent to 13.9 percent (see NIPA table 5.1)

NOTE: See note to table 1 for an explanation of chained (1996) dollar series. Chained (1996) dollar levels and residuals for most items are shown in NIPA table 1.4. Detail on motor vehicle output is shown in NIPA table 8.9B.

Personal Consumption Expenditures

In the second quarter, real personal consumption expenditures increased about as much as in the two preceding quarters combined (table 4 and chart 2).

Purchases of durable goods turned up sharply, reflecting the pattern set by motor vehicles. Light trucks—pickups, vans, and sport utility vehicles—increased after decreasing, and new autos increased almost as much as in the first quarter. Furniture and household equipment increased vigorously after little change, as purchases of computer equipment accelerated. “Other” durable goods, which include items such

as pleasure boats and motorcycles, also increased more than in the first quarter.

A slowdown in purchases of nondurable goods was mainly accounted for by food, but energy goods and “other” nondurable goods also contributed. (“Other” goods include such items semidurable house furnishings and nonprescription drugs.) Among energy products, most of the falloff was accounted for by gasoline and oil.

Purchases of services stepped up, mainly reflecting upturns in recreation and in “other” services. The

1. Includes jewelry and watches, ophthalmic products and orthopedic equipment, books and maps, bicycles and motorcycles, guns and sporting equipment, photographic equipment, boats, and pleasure aircraft.

2. Includes tobacco, toilet articles, drug preparations and sundries, stationery and writing supplies, toys, film, flowers, cleaning preparations and paper products, semidurable house furnishings, and magazines and newspapers.

3. Includes personal care, personal business, education and research, religious and welfare activities, and net foreign travel.

NOTE. See note to table 1 for an explanation of chained (1996) dollar series. Chained (1996) dollar levels and residuals are shown in NIPA tables 2.3 and 8.9B (motor vehicles). Percent changes in major aggregates are shown in NIPA table S.1.

Chart 2. Real Personal Consumption Expenditures

strengthening in recreation services reflected an upturn in movie theater ticket sales and a step-up in “participant amusements,” such as casino gambling. The strengthening in “other” services partly reflected an upturn in brokerage charges and investment counseling.

Factors frequently considered in the analysis of consumer spending were mixed in the second quarter (chart 3). Real DPI accelerated.³ The Index of Consumer Sentiment (from by the University of Michigan’s Survey Research Center) increased after three consecutive quarterly decreases. However, the unemployment rate also moved higher.

3. DPI is affected by many factors, one of which is mortgage refinancing. In the second quarter, the value of home mortgage originations approached \$1 trillion; between two-thirds and three-fourths of these originations represented refinancing. In the month that a mortgage is refinanced, closing costs lower DPI; in subsequent months, higher rental income (reflecting lower mortgage payments) raises DPI.

Refinancing also allows homeowners to convert some of their home equity into cash. However, in the second quarter of 2003, the share of refinancers doing so was at its lowest level in years. See Freddie Mac, “Share of Refinancers Taking Cash Out of Home Equity Plumets to Lowest Level Since 1985” (news release, July 30, 2003, <www.freddie.com/news/archives/rates/2003/2qub03.html>).

Chart 3. Selected Factors Affecting Consumer Spending

Private Fixed Investment

Real private fixed investment increased in the second quarter after changing little in the first (table 5 and chart 4).

Nonresidential. Information-processing equipment and software increased almost twice as much as in the first quarter and more than at any time in the past 3 years; computers accounted for about half of the increase. Transportation equipment decreased less than in the first quarter; the difference mainly reflected an upturn in truck investment. Industrial equipment decreased for the third consecutive quarter; the decrease would have been larger if special industry machinery (which includes equipment for manufacturing semi-conductors) had not increased.

In structures, increases in oil-well exploration and drilling and in nonresidential buildings more than offset a decrease in the construction of utilities. In percentage terms, the oil-well increase was the largest since 1987, though increases almost as large had been posted in 1997 and in 2000. The second-quarter increase in nonresidential buildings was also notable; though modest, it followed 10 consecutive quarterly decreases that had reduced the level of investment in nonresidential buildings almost 30 percent. The decrease in the construction of utilities was the seventh in the past eight quarters.

The capacity utilization rate for manufacturing, mining, and utilities slid lower in the second quarter after showing little, if any, trend over the preceding year and a half. However, other factors

Equipment	10.4	0.0	0.1	0.1	0.5	-0.3	3.0	5.3	19.0

1. "Computers and peripheral equipment" include new items only; "software" excludes software "embedded" or bundled, in computers and other equipment. Because of the large price changes that characterize the components of information processing equipment, the nonadditivity of the chained-dollar estimates is substantial, and the relative importance of the components cannot be inferred on the basis of these estimates. Contributions may be taken directly from NIPA table 8.4.

2. Includes home improvements, new manufactured home sales, brokers' commissions on home sales, net purchases of used structures, and other residential structures (which consists primarily of dormitories and of fraternity and sorority houses).

NOTE: See note to table 1 for an explanation of chained (1996) dollar series. Chained (1996) dollar levels and residuals are shown in NIPA tables 5.5 and 8.9B (motor vehicles). Percent changes in major aggregates are shown in NIPA table S.1.

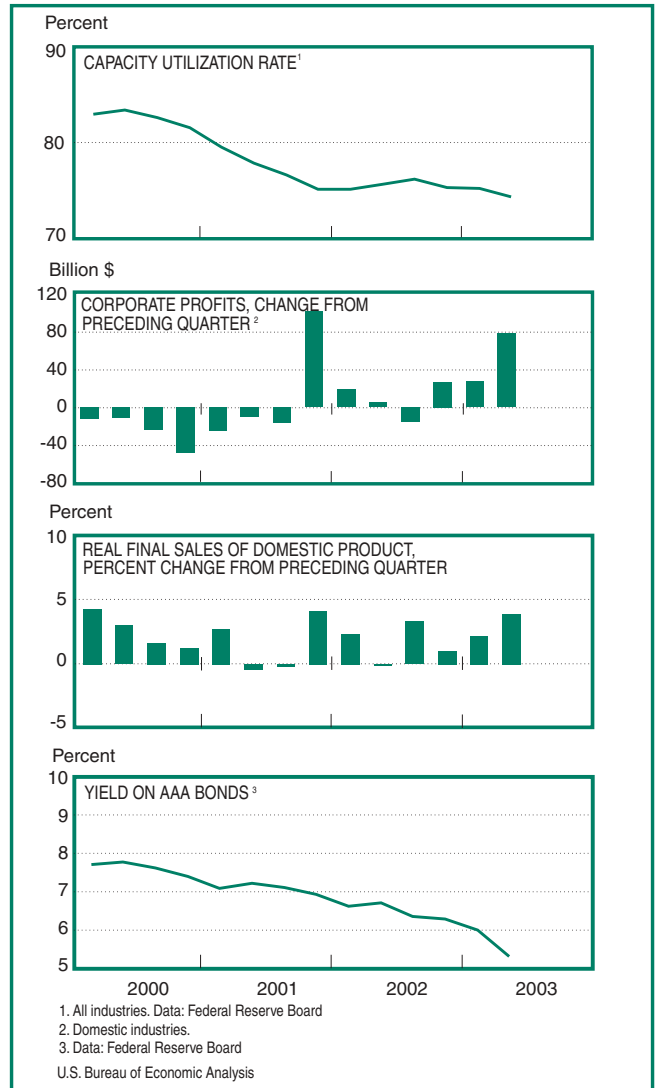

Chart 4. Real Private Fixed Investment

that are frequently considered in the analysis of investment spending were generally favorable (chart 5). Long-term interest rates continued to fall in the second quarter, final sales strengthened, and profits improved. Domestic corporations' profits from current production, which increased for the sixth time in seven quarters, were more than 40 percent higher than in the third quarter of 2001 and more than 5 percent higher than their previous high (in the third quarter of 1997).

Residential. Real private residential investment increased 4.5 percent, less than half the first-quarter increase (table 5 and chart 4). Single-family construction changed little, and multifamily construction decreased. In contrast, "other" structures increased substantially, reflecting a jump in brokers' commissions.

Chart 5. Selected Factors Affecting Nonresidential Investment

Inventory Investment

Real inventory investment decreased again in the second quarter, as inventory accumulation gave way to inventory liquidation (table 6 and chart 6). In the first quarter, the decrease in inventory investment had reflected a slowdown in the pace of accumulation.

Retail trade inventories increased less than in the first quarter. Inventory accumulation by motor vehicle dealers slowed, and inventories of clothing stores decreased slightly after increasing. These changes were partly offset by a swing from liquidation to accumulation in the inventories of stores that sell home furniture and furnishings, electronics, and appliances.

Manufacturing inventories decreased more in the second quarter than in the first. Inventories of primary metal manufacturers and of food manufacturers decreased after increasing. Inventories of machinery manufacturers also decreased, though considerably less than in the first quarter.

Wholesale trade inventories also decreased more in the second quarter than in the first. Inventories of professional and commercial equipment (including computers) and of drugs and sundries increased less than in the first quarter. Inventories of groceries and related products decreased more than in the first quarter. Inventories of hardware, plumbing, and heating supplies

decreased after increasing. These changes were partly offset by upturns in inventories of petroleum and of farm products.

Inventories in the construction, mining, and utilities group decreased less than in the first quarter. Inventories held by utilities were mainly responsible.

Farm inventories decreased in the second quarter after increasing in the first. Livestock inventories turned down, and crop inventories increased a little less than in the first quarter.

The ratio of real private nonfarm inventories to final sales of goods and structures decreased to 3.56 from 3.61 (see NIPA table 5.13B). A ratio that includes all final sales of domestic businesses decreased to 1.98 from 2.01.⁴ Both ratios have been trending down since the mid-1970s.

4. Using the ratio that includes all final sales of domestic businesses in the denominator implies that the production of services results in a demand for inventories that is similar to that generated in the production of goods and structures. In contrast, using the "goods and structures" ratio implies that the production of services does not generate demand for inventories. Both implications are extreme. Production of some services may require substantial inventories, while production of other services may not.

1. Includes inventories held by establishments in the following industries: transportation; communication; finance, insurance, and real estate; and services.

Note. See note to table 1 for an explanation of chained (1996) dollar series. Chained (1996) dollar levels and residuals are shown in NIPA tables 5.11B and 8.9B (motor vehicles).

Exports and Imports

Real exports of goods and services decreased about as much as in the first quarter. Exports of goods turned down, while exports of services turned up (table 7 and chart 7).

In goods, all categories except nonautomotive consumer goods contributed to the second-quarter drop. Exports of foods and industrial supplies posted the biggest decreases; both were roughly 5 percent below their peak levels reached in the third quarter of 2000.

In services, passenger fees and travel decreased less

than in the first quarter, and “other transportation” increased after decreasing.

Real imports of goods and services increased after decreasing (table 7 and chart 8). Imports of goods turned up, while imports of services decreased more than in the first quarter.

In goods, all categories contributed to the second-quarter increase except nonautomotive consumer goods, which were unchanged. Imports of petroleum products, nonautomotive capital goods, and “other”

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services.

Note. See note to table 1 for an explanation of chained (1996) dollar series. Chained (1996) dollar levels and residuals are shown in NIPA table 4.4. Percent changes in major aggregates are shown in NIPA table S.1.

Chart 7. Real Exports

goods contributed the most. Petroleum products and “other” goods both increased more than 50 percent at an annual rate. The surge in petroleum imports was the biggest in 7 years, and the level of petroleum imports was almost 5 percent above its previous peak (reached in the second quarter of 2001). After the most recent increase, imports of capital goods were almost

10 percent higher than in the fourth quarter of 2001, but they were still almost 15 percent lower than in the fourth quarter of 2000. The jump in “other” goods was the biggest in almost 3 years and represented a rebound from a sharp first-quarter drop.

In services, travel accounted for most of the second-quarter decrease.

Chart 8. Real Imports

Government Spending

Government spending increased 8.2 percent in the second quarter after increasing 0.4 percent in the first (table 8 and chart 9). Spending by the Federal Government surged; spending by state and local governments decreased a little after increasing slightly.

At the Federal level, spending on national defense jumped 45.9 percent in the second quarter. As was explained in last month's "Business Situation," most of the increase represented a step-up to a higher level of support services for installations, weapons, and personnel, including support services associated with the U.S. role in securing and reconstructing Iraq. In addition, compensation of military personnel increased substantially for the second quarter in a row.⁵

Federal nondefense spending decreased 5.4 percent, the biggest decrease since the third quarter of 2000; the

5. The increases in compensation mainly reflected increases in the number of military reservists called to active duty; reserve strength peaked at the end of April.

drop was accounted for by services (other than services rendered by employees and by government-owned fixed capital).

At the state and local level, consumption expenditures changed little, while gross investment decreased. In gross investment, a decrease in structures was only partly offset by an increase in equipment and software.

Chart 9. Real Government Consumption and Investment

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
 Note: See note to table 1 for an explanation of chained (1996) dollar series. Chained (1996) dollar levels and residuals are shown in NIPA table 3.8. Percent changes in major aggregates are shown in NIPA table S.1.

Prices

Inflation slowed in the second quarter. The price index for gross domestic purchases, which measures prices of goods and services purchased by U.S. residents, increased only 0.2 percent after increasing 3.4 percent (table 9). Much of the slowdown was accounted for by energy prices; excluding food and energy, prices increased 0.6 percent after increasing 1.8 percent (chart 10). In the first quarter, prices had been boosted by a pay raise for Federal military and civilian personnel.⁶

Prices of goods and services purchased by consumers increased 0.7 percent, 2 percentage points less than

6. In the NIPAs, an increase in the rate of Federal employee compensation is treated as an increase in the price of employee services purchased by the Federal Government. In the first quarter, about 0.2 percentage point of the increase in prices was accounted for by the pay raise.

in the first quarter. Food prices increased more than in the first quarter, but energy prices decreased after surging. Excluding the prices of food and energy, prices paid by consumers increased 0.9 percent, about the same as in the first quarter.

Prices paid by government decreased 0.5 percent in the second quarter, as a decrease at the state and local level more than offset an increase at the Federal level. The drop in prices paid by state and local governments, the biggest since the mid-1950s, mainly reflected the fall in energy prices.

Prices of private nonresidential fixed investment decreased for the seventh time in eight quarters. Prices of equipment and software decreased as much as in the first quarter, and prices of structures decreased after increasing.

The GDP price index, which measures the prices paid for goods and services produced in the United States, increased 0.8 percent after increasing 2.4 percent. GDP prices increased more than gross domestic purchases prices because export prices increased while import prices declined. The decline in import prices was dominated by petroleum.

Chart 10. Gross Domestic Purchases Prices: Change From Preceding Quarter

Revisions

The preliminary estimate of a 3.1-percent increase in real GDP in the second quarter is 0.7 percentage point higher than the advance estimate released last month (table 10). In the past 20 years, the average revision, without regard to sign, from the advance estimate to the preliminary estimate was 0.5 percentage point.

The larger-than-usual revision to second-quarter real GDP mainly reflected the incorporation of revised and newly available source data for exports and imports, for consumer spending, and for state and local government spending.

The growth of personal consumption expenditures was revised up 0.5 percentage point, mainly reflecting revised Census Bureau data on retail sales of goods for May and June. The revision to nondurable goods contributed an additional 0.22 percentage point to real GDP growth; the revision to durable goods, 0.10 percentage point.

Export growth was revised up 1.9 percentage points, and import growth was revised down 1.3 percentage points. (Imports are subtracted in the calculation of GDP.) Both revisions reflected the incorporation of newly available Census Bureau data on goods for June, revised data on goods for May, and revised BEA data on services for the quarter. The export revision contributed an additional 0.19 percentage point to real GDP growth; the import revision, 0.17 percentage point.

State and local government spending was revised up 0.8 percentage point, reflecting newly available Census Bureau data on the value of construction put in place for June and revised data for April and May. The revision contributed an additional 0.10 percentage point to real GDP growth.

These revisions were partly offset by a downward revision to inventory investment that subtracted 0.10 percentage point from real GDP growth. The revision reflected benchmark revisions to the Census Bureau's

M3 survey ("Manufacturers' Shipments, Inventories, and Orders"), which were incorporated into the NIPA estimates on a "best-change" basis.

GDP price index	1.0	0.8	-0.2	

NOTE: The preliminary estimates for the second quarter of 2003 incorporate the following revised or additional major source data that were not available when the advance estimates were prepared.

Personal consumption expenditures: Retail sales for May and June (revised), consumers' share of new-car and of new truck purchases for June, average unit value for domestic new autos for June (revised), and brokerage services data for the second quarter.

Nonresidential fixed investment: Construction put-in-place for April and May (revised) and June, manufacturers' shipments of machinery and equipment for January through June (revised), and manufacturers' shipments of complete civilian aircraft for May (revised) and June.

Residential fixed investment: Construction put-in-place for April and May (revised) and December.

Change in private inventories: Manufacturing and trade inventories for January through May (revised) and June.

Exports and imports of goods and services: Exports and imports of goods for May (revised) and June.

Government consumption expenditures and gross investment: Monthly Treasury Statement detailed data for June and state and local government construction put-in-place for April and May (revised) and June.

Wages and salaries: Employment, average hourly earnings, and average weekly hours for May and June (revised).

GDP prices: Detailed merchandise export and import price indexes for April through June (revised), unit-value index for petroleum imports for May (revised) and June, and housing prices for the second quarter.

Corporate Profits

Profits from current production increased \$88.3 billion (10.8 percent at a quarterly rate) in the second quarter (table 11).⁷ The after-tax measure of current-production profits increased even more—\$92.1 billion (15.9 percent). The bigger increase in the after-tax measure reflects the higher depreciation—and, thus, the lower taxable earnings and the lower tax liability—that resulted from this year's tax act. (The effects of the tax act on profits are described below.)

Profits of domestic nonfinancial corporations increased \$64.6 billion (13.3 percent), mainly reflecting an increase in profits per unit that resulted from bigger declines in unit labor and nonlabor costs than in prices. Profits of domestic financial corporations increased \$14.2 billion (6.4 percent). Profits from the rest of the world increased \$9.6 billion (9.0 percent), as payments by domestic affiliates to their foreign parents decreased, and receipts by domestic parents from their foreign affiliates increased.⁸

Cash flow from current production, a profits-related measure of internally generated funds available for investment, increased \$78.5 billion.⁹ The ratio of

cash flow to nonresidential fixed investment, an indicator of the extent to which the current level of investment could be financed by internally generated funds, jumped to 93.2 percent from 87.4 percent in the first quarter. The jump reflects the higher depreciation provided for by the new tax act.

Change in tax law. The Jobs and Growth Tax Relief Reconciliation Act of 2003 (signed into law on May 28, 2003) increased the immediate depreciation writeoff from 30 percent to 50 percent for property that was acquired after May 5, 2003, and that was placed in service before January 1, 2005. (Last year, the Job Creation and Worker Assistance Act of 2002 had provided for the immediate 30-percent writeoff of certain investments contracted for after September 10, 2001, and before September 11, 2004.)

The additional depreciation provided for by this year's act is estimated to have increased depreciation expenses in the second quarter by \$75.2 billion (annual rate) and reduced profits before tax (PBT)—which is based on earnings reported on tax returns—by the same amount (table 12). Reflecting the lower level of PBT, profits tax liability was reduced \$18.8 billion, and

7. Profits from current production is estimated as the sum of profits before tax, the inventory valuation adjustment, and the capital consumption adjustment; it is shown in NIPA tables 1.9, 1.14, 1.16, and 6.16C (see "Selected NIPA Tables," which begins on page D-2) as corporate profits with inventory valuation and capital consumption adjustments.

Percent changes in profits are shown at quarterly, not annual, rates.

1. At quarterly rates.

2. Profits from current production are corporate profits with inventory valuation and capital consumption adjustments.

profits after tax were reduced \$56.4 billion.

Profits from current production were not affected by the act, because unlike PBT, they do not depend on the depreciation-accounting practices used for Federal income tax purposes; instead, they reflect an estimate of depreciation that is based on the current value of fixed capital actually used up in the production process. However, because the act reduced tax liability,

profits from current production *on an after-tax basis* were raised \$18.8 billion.

The capital consumption adjustment (CCAdj) is the difference between the depreciation specified in the tax code and the depreciation that underlies profits from current production; because the act raised tax depreciation \$75.2 billion, the CCAdj increased by the same amount.

Government Sector

The combined current deficit of the Federal Government and of state and local governments increased \$56.6 billion, to \$398.8 billion, in the second quarter after increasing \$33.2 billion in the first (table 13).¹⁰ The Federal current deficit increased in both quarters, but the increase in the second quarter was much larger than that in the first. The state and local current deficit decreased in the second quarter after increasing in the first.

Federal

The Federal Government current deficit increased \$108.1 billion in the second quarter after increasing \$18.7 billion in the first. Current receipts decelerated, while current expenditures accelerated sharply.

Current receipts. Federal current receipts increased \$6.0 billion in the second quarter after increasing \$9.0 billion in the first. The deceleration was more than accounted for by a downturn in corporate profits tax accruals and a deceleration in contributions for social insurance. Tempering the deceleration in receipts, personal tax and nontax receipts and indirect business tax and nontax accruals turned up.

Corporate profits tax accruals decreased \$4.3 billion after increasing \$13.2 billion. The downturn reflected the effects of the Jobs and Growth Tax Relief Reconciliation Act of 2003, which reduced Federal corporate taxes by \$16.4 billion.

Contributions for social insurance increased \$3.9 billion after increasing \$13.2 billion. The deceleration was partly accounted for by a deceleration in contributions by employers, employees, and the self-employed for social security (old-age, survivors, disability, and health insurance trust funds), which increased \$3.3 billion after a \$7.6 billion increase in the first quarter. In the first quarter, social security contributions were boosted \$2.4 billion by an increase in the maximum taxable wage base. State unemployment insurance contributions also decelerated; contributions in the first quarter were boosted \$3.4 billion by increases in

10. The combined current surplus or deficit is the NIPA measure of net saving by government. Net saving equals gross saving less consumption of fixed capital. These estimates are shown in NIPA table 5.1.

1. "Net lending or borrowing" is conceptually similar to "net financial investment" in the flow-of-funds accounts prepared by the Board of Governors of the Federal Reserve System. The two measures differ primarily because government net lending or borrowing is estimated from data for transactions, whereas net financial investment is estimated from data for financial assets. There are also small conceptual differences, such as the classification of the Federal Government's railroad retirement and veterans life insurance programs.

the contribution rates and in states' wage bases.

Personal tax and nontax receipts increased \$5.8 billion after decreasing \$17.2 billion. The upturn was attributable to an upturn in personal income taxes. Within personal income taxes, nonwithheld income taxes decreased \$0.9 billion after decreasing \$21.6 billion. The first-quarter decrease reflected the incorporation of new levels for final settlements, refunds, and back taxes that reduced taxes \$21.5 billion. In addition, withheld income taxes accelerated in the second quarter, increasing \$6.6 billion after a \$4.3 billion increase.

Indirect business tax and nontax accruals increased \$0.7 billion after decreasing \$0.3 billion. Nontaxes accelerated, excise taxes decreased less than in the first quarter, and customs duties decelerated.

Current expenditures. Current expenditures increased \$114.1 billion in the second quarter after increasing \$27.7 billion in the first. The sharp acceleration was mostly accounted for by an upturn in grants-in-aid to state and local governments and by an acceleration in consumption expenditures, specifically in national defense expenditures. In addition, "subsidies less current surplus of government enterprises" accelerated, and net interest paid turned up. In contrast, "transfer payments (net)" decelerated, and wage accruals less disbursements turned down.

Grants-in-aid to state and local governments increased \$38.4 billion after decreasing \$2.8 billion. Grants for central executive, legislative, and judicial activities accelerated as a result of a new Temporary State Fiscal Relief Fund, which was authorized as part of the Jobs and Growth Tax Relief Reconciliation Act of 2003; payments to states from this fund began in June. Grants for Medicaid, for welfare and social services, for housing and community services, and for health and hospitals (including payments to states for children's health insurance programs) all turned up. Grants for natural resources and for national defense accelerated.

Consumption expenditures increased \$37.6 billion after increasing \$17.7 billion. The acceleration was accounted for by a sharp acceleration in defense consumption expenditures that was partly offset by a downturn in nondefense consumption expenditures.

Defense consumption expenditures increased \$42.9 billion after increasing \$5.5 billion. The acceleration was more than accounted for by services. Within services, "other services" (which includes research and development, weapon support, installation support, and personnel support) turned up, increasing \$34.4 billion after a \$6.2 billion decrease. This upturn was partly offset by a deceleration in compensation of employees, which increased \$4.2 billion after increasing \$11.1 billion; the deceleration was mostly accounted

for by the January 2003 pay raise, which boosted compensation \$4.9 billion in the first quarter. Also within other services, transportation of materials and travel of persons both decelerated; the buildup leading to Operation Iraqi Freedom boosted spending for travel and transportation in the first quarter. Nondurable goods turned down, decreasing \$0.3 billion after a \$0.8 billion increase; the downturn was more than accounted for by a downturn in petroleum products.

Nondefense consumption expenditures turned down, decreasing \$5.3 billion after increasing \$12.1 billion. The downturn was more than accounted for by services. "Other services" turned down, decreasing \$7.1 billion after a \$6.3 billion increase. Compensation of employees decelerated, increasing \$0.5 billion after increasing \$5.8 billion; compensation was boosted \$2.8 billion in the first quarter by the January 2003 pay raise.

"Subsidies less current surplus of government enterprises" increased \$15.4 billion after increasing \$1.4 billion. The acceleration was mostly accounted for by a sharp acceleration in subsidies. This acceleration reflected the impact of the Emergency Wartime Supplemental Appropriations Act of 2003; the legislation authorized increased airline subsidies and increased funding for homeland security that affected maritime subsidies used for port security purposes. As a result, airline subsidies accelerated, increasing \$10.0 billion after increasing \$0.4 billion, and maritime subsidies accelerated, increasing \$1.5 billion after increasing \$0.6 billion. Agricultural subsidies also accelerated, increasing \$3.7 billion after a \$2.8 billion increase. The current surplus of government enterprises turned down, decreasing \$1.1 billion after increasing \$1.8 billion. The downturn was attributable to a downturn in the Postal Service current surplus, which partly reflected the effects of the Postal Civil Service Retirement System Funding Reform Act of 2003 that decreased contributions to the civil service retirement fund.

Net interest paid increased \$2.3 billion after decreasing \$9.4 billion. Gross interest paid turned up, increasing \$2.6 billion after decreasing \$8.4 billion, reflecting an upturn in gross interest paid to persons and business. Gross interest paid to the rest of the world decreased less than in the first quarter. Gross interest received decelerated, increasing \$0.2 billion after increasing \$1.0 billion; gross interest received from the rest of the world decreased more than in the first quarter.

"Transfer payments (net)" decelerated, increasing \$17.6 billion after a \$22.2 billion increase. Transfer payments to the rest of the world turned down, decreasing \$2.5 billion after increasing \$5.6 billion; the

downturn was accounted for by a downturn in government grants. Transfer payments to persons accelerated, increasing \$20.0 billion after increasing \$16.7 billion. Benefit payments for unemployment programs turned up, increasing \$4.1 billion after decreasing \$2.3 billion. Benefit payments for Medicare (hospital and supplemental medical insurance), for food stamps, and for supplemental security income accelerated.

State and local

The state and local government current deficit decreased \$51.4 billion in the second quarter after increasing \$14.5 billion in the first. Current receipts accelerated, while current expenditures decelerated.

Current receipts. State and local government current receipts increased \$51.8 billion in the second quarter after increasing \$12.4 billion in the first. The acceleration was more than accounted for by the upturn in Federal grants-in-aid, which increased \$38.4 billion after decreasing \$2.8 billion. Indirect business tax and nontax receipts increased \$9.8 billion after increasing \$8.6 billion. In contrast, corporate profits tax accruals decelerated, increasing \$0.6 billion after a \$2.3 billion increase. Personal tax and nontax receipts also decelerated, increasing \$3.0 billion after increasing \$4.3 billion.

Current expenditures. Current expenditures decelerated, increasing \$0.4 billion in the second quarter after increasing \$26.9 billion in the first. Consumption expenditures turned down, “subsidies less current surplus of government enterprises” turned down slightly, and transfer payments to persons decelerated.

Consumption expenditures decreased \$4.0 billion after increasing \$21.7 billion. The downturn was mostly accounted for by nondurable goods, which decreased \$8.0 billion after increasing \$13.4 billion.

Within nondurable goods, petroleum turned down sharply. Services decelerated, increasing \$3.9 billion after a \$8.0 billion increase.

“Subsidies less current surplus of government enterprises” decreased \$0.1 billion after increasing \$0.5 billion. Transfer payments to persons decelerated, increasing \$4.3 billion after a \$4.7 billion increase; the deceleration was mostly accounted for by a reduction in Medicaid payments.

Net lending or net borrowing

“Net lending or net borrowing (–)” is an alternative measure of the government fiscal position. Net lending is the financing requirement of the government sector and is derived as the current surplus plus the consumption of fixed capital and “capital transfers received (net)” less gross investment and net purchases of nonproduced assets.¹¹

Net borrowing increased \$65.6 billion in the second quarter after increasing \$28.7 billion in the first. Federal Government net borrowing increased \$129.9 billion as the result of the increase in its current deficit. Federal net capital transfers turned down, partly as the result of an upturn in capital transfers to state and local governments. State and local government net borrowing decreased \$64.3 billion as a result of a decrease in its current deficit and an upturn in state and local net capital transfers.

Government gross investment accelerated, increasing \$4.5 billion after increasing \$1.4 billion. Federal Government gross investment accelerated, while state and local government gross investment turned down.

¹¹ Net lending or net borrowing estimates are shown in NIPA tables 3.1–3.3.

Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts

Statistical Changes

By Carol E. Moylan and Brooks B. Robinson

ON December 10, 2003, the Bureau of Economic Analysis (BEA) will release the results of the 12th comprehensive, or benchmark, revision of the national income and product accounts (NIPAs). The last such revision was released in October 1999.

This article, which describes statistical changes, is the fourth in a series of SURVEY OF CURRENT BUSINESS articles about the comprehensive revision. An article in the January 2003 issue described the effects of incorporating the 1997 benchmark input-output (I-O) accounts and identified some of the proposals being considered for this comprehensive revision.¹ An article in the June 2003 issue described major changes in definitions and classifications that will be introduced as part of this comprehensive revision.² An article in the August 2003 issue described the new and redesigned tables that will be presented as part of the comprehensive revision.³ The results of the comprehensive revision will be released in December 2003 and an article in the January 2004 SURVEY will describe the revised NIPA estimates, discuss the effects of the definitional and statistical changes, and present the new tables.

Statistical changes are changes in estimation procedures that are generally made to incorporate new methods or techniques or to incorporate data from new sources; an example is the adoption of chain-type indexes in the 1996 comprehensive revision, so that the growth rate of real gross domestic product (GDP) and its components became invariant to the choice of reference period.⁴ Other statistical changes address data gaps and other shortcomings; an example is the adoption of the Census Bureau's annual *Government*

Finances tabulations as the source for most state and local taxes in the 1999 comprehensive revision; BEA is extending this change as part of this comprehensive revision (see the section "Changes in Methodology").⁵

The major statistical changes that will be introduced in this comprehensive revision are as follows.

- Incorporate the 1997 benchmark I-O accounts, which provide the most comprehensive and detailed picture available of the U.S. economy; these accounts set the level of GDP and other NIPA components for the benchmark year, and they provide key information for the estimates before and after the benchmark year
- Convert the estimates of income and employment by industry to the North American Industry Classification System basis in order to better measure the changing composition of economic activity, especially for the services industries
- Incorporate a new adjustment to the estimates of corporate profits for the most recent year of an annual revision (2002 for this benchmark revision) in order to reflect available information on the exercise of employee stock options
- Incorporate new BEA price indexes for deflation of nonresidential structures and photocopying equipment in order to improve the measures of real GDP by adjusting for quality change
- Improve the estimates of motor vehicle output to reflect new methodologies for estimating total dealers' margins and net transactions in used motor vehicles and for allocating exports and imports of motor vehicles between autos and trucks
- Improve the estimates of personal consumption expenditures (PCE) for hotel and motel services to reflect new source data on the consumer share of U.S. residents' lodging expenditures by sector and on lodging expenditures by foreign visitors
- Improve the estimates of employer contributions to pension and profit-sharing plans to reflect the

adoption of accrual accounting and new coverage adjustments⁶

- Improve the estimates of Medicare social benefits to reflect the adoption of accrual accounting
- Improve the estimates of imputed interest paid by life insurance carriers to better reflect their investment income
- Incorporate a new methodology for estimating state and local current taxes to reflect more reliable source data

As described in the June SURVEY, BEA will incorporate two important definitional changes—one for insurance services and one for banking services—that will also feature significant statistical changes.⁷ First, property and casualty insurance services (other than health insurance) will be redefined to recognize the implicit services that are funded by investment income and to provide a more appropriate treatment of insured losses. To supplement the value of the premiums received, BEA plans to add the value of the expected investment income on the funds on which policyholders have claim. Additionally, in calculating the value of insurance services, expected losses, rather than actual losses incurred in a period, will be deducted.⁸

Second, PCE, exports of services, government consumption expenditures, and interest paid and received will reflect the change in definition that recognizes the implicit services provided to borrowers by commercial banks. BEA will allocate a portion of the interest paid by borrowers to banks as an expenditure for implicit services, and the interest paid by the borrower and received by the bank will be reduced by the amount of the imputed expenditures for borrower services. This reduction in borrower interest will be accomplished by recording negative imputed interest paid by borrowers and received by banks.⁹

6. Leading up to this comprehensive revision, BEA undertook research to improve the accrual-accounting basis of the NIPA estimates. Accrual accounting records flows at the time economic value is created, transformed, exchanged, transferred, or extinguished. This effort was called for in *BEA's Strategic Plan for FY 2003–FY 2007* in order to improve the consistency between the NIPAs and international guidelines. (Go to BEA's Web site <www.bea.gov>, click on "About BEA," and find the bullet for "Strategic Plan for 2003–2007" near the bottom of the page.)

7. See Moulton and Seskin, 19–27.

8. An article that provides the methodology for preparing NIPA estimates of property and casualty insurance services under the new definition will appear in a forthcoming issue of the SURVEY.

9. For the methodology used to prepare NIPA estimates of the implicit services provided by commercial banks under the new definition, see Dennis J. Fixler, Marshall B. Reinsdorf, and George M. Smith, "Measuring the Services of Commercial Banks in the NIPAs: Changes in Concepts and Methods," in this issue.

The remainder of this article describes the newly available and revised source data and the major methodological changes that will be incorporated in this comprehensive revision (see table 1).

Newly Available and Revised Source Data

In a comprehensive NIPA revision, the number of years subject to revision is greater than in an annual NIPA revision, when typically only the estimates for the 3 most recent years are revised. Consequently, newly available and revised source data that become available less often than annually or that cover periods outside the scope of annual revisions are incorporated in comprehensive revisions. Source data that have become available since the 1999 comprehensive revision that would not normally be fully incorporated in a regular annual NIPA revision are referred to as "regular benchmark source data." These data are typically available with a long lag, and they generally go back no further than 10 years; examples include the data from the decennial and quinquennial censuses.

This comprehensive revision also includes the annual NIPA revision that would normally have occurred in July 2003. The source data that would normally have been incorporated in that revision are referred to as "regular source data for 2000–2002"; an example is the 2001 *Statistics of Income* (SOI) data from the Internal Revenue Service (IRS).

The first step in preparing this comprehensive NIPA revision is the incorporation of the 1997 levels for key components from BEA's 1997 benchmark I-O accounts, adjusted to reflect NIPA changes in definition and classification. In addition, detailed industry and commodity information from the I-O accounts is used to revise the proportions of final and intermediate purchases that are used in the abbreviated commodity-flow, retail-control, and other methods to extrapolate product-side estimates for years after 1997. The NIPA estimates are also revised to reflect newly available and revised source data.

Regular benchmark source data

The revised NIPA estimates will incorporate the following regular benchmark source data: Data from BEA's benchmark 1997 I-O accounts, data from the 1997 quinquennial economic censuses, and annual source data that were not available in time for incorporation during the annual NIPA revisions.

The 1997 benchmark I-O accounts. The benchmark I-O accounts are the single most important sta-

tistical source for the comprehensive revisions of the NIPA level of GDP for the benchmark year, and they NIPAs. The I-O accounts are used to establish the provide critical information for estimating GDP for

Table 1. Major Methodological Changes

Changes	Components	Initial year of revision
Product-side changes		
Improved estimates of property and casualty insurance services	Personal consumption expenditures, exports and imports of services, state and local government consumption expenditures	1929
Improved estimates of banking services	Personal consumption expenditures, exports of services, Federal and state and local government consumption expenditures	1929
Improved estimates of motor vehicle output	Personal consumption expenditures, private equipment and software, change in private inventories	1985
Improved estimates of hotel and motel services	Personal consumption expenditures	1978
Improved estimates of gasoline	Personal consumption expenditures	1993
Improved estimates of prescription drugs	Personal consumption expenditures	1997
Improved estimates of output and income of nonprofit institutions serving households	Personal consumption expenditures, components of personal income	1992
Improved estimates of software	Private equipment and software, Federal and state and local government gross investment	1977
Improved estimates of residential improvements	Residential structures	1987
Improved estimates of nondefense gross investment in enterprise equipment	Federal nondefense gross investment, current surplus of government enterprises	1993
Income-side changes		
Incorporation of NAICS data	Income and employment	1998
Improved estimates of employer contributions to pension plans	Employer contributions for employee pension and insurance funds	1978
Improved estimates of private and state and local government employer contributions for health insurance	Personal consumption expenditures, employer contributions for employee pension and insurance funds	1987
Improved estimates of Federal employer contributions for health insurance	Employer contributions for employee pension and insurance funds	1993
Improved estimates of partnership income	Nonfarm proprietors' income	1987
New employee stock-options adjustment	Corporate profits	2002
Improved estimates of property and casualty insurance services	Rental income of persons, net interest, business transfer payments to persons and government, personal interest income, rest-of-the-world income	1929
Improved estimates of banking services	Net interest	1929
Improved estimates of portfolio interest	Nonfarm proprietors' income, net interest	1987
Improved estimates of imputed interest	Personal consumption expenditures, net interest	1977
Improved estimates of state and local government current taxes	State and local government current taxes	1988
Improved estimates of Federal Medicare social benefits	Federal current transfer payments	1967
Improved estimates of state and local Medicaid social benefits	State and local government current transfer payments	2003
Quantities and prices		
New PCE market-based prices and quantities	Personal consumption expenditures	1929
New prices:		
For medical care and hospitalization insurance benefits	Personal consumption expenditures, state and local government consumption expenditures	1988
For change in farm inventories	Change in farm inventories	1977
For selected types of nonresidential structures	Nonresidential, Federal, and state and local government gross investment in structures	1997
For photocopying equipment	Private equipment and software, imports of goods	1992
For own-account software	Private equipment and software, Federal and state and local government gross investment in equipment and software	1959
For Federal nondefense sales of services	Federal nondefense consumption expenditures	1998
Consumption of fixed capital		
Improved estimates of aircraft	Corporate profits, nonfarm proprietors' income	1960
New estimates of light trucks separately identified	Corporate profits, nonfarm proprietors' income	1992
Improved estimates of autos	Corporate profits, nonfarm proprietors' income	1991
Changes carried back from the 2000–2002 annual revisions ¹		
NAICS-based estimates of services (2001)	Personal consumption expenditures	1997
Improved estimates of closing costs (2002)	Rental income of persons	1998
Improved estimates of interest paid by persons to business (2001)	Personal interest payments	1980
Improvements to the international transactions accounts (2000–2002)	Exports and imports of goods and services	1982
New prices:		
For net foreign travel (2002)	Personal consumption expenditures	1987
For local area network equipment (2001)	Private equipment and software	1992
For Federal defense and nondefense consumption expenditures (2002) ...	Federal consumption expenditures	1993

1. The year in parentheses refers to the August SURVEY in which the change was described.
NAICS North American Industry Classification System

periods after the benchmark year.¹⁰ For NIPA benchmark year estimates, the I-O accounts provide information on the portion of gross output going to final uses. As a result, the estimate of GDP avoids double counting (of, for example, the semiconductors that go into computers or the flour that goes into bread).

The 1997 I-O accounts provide the benchmark for the estimates of PCE, private fixed investment (PFI), and parts of several income components, and they provide the commodity weights for the change in private inventories and the type-of-product detail for state and local government consumption expenditures and gross investment.¹¹ The I-O estimates are used as benchmarks because they are based on detailed industry and commodity statistics collected by the Census Bureau in the quinquennial economic censuses and because they are prepared within an internally consistent framework that tracks the flows of inputs and outputs in the economy.¹² In addition, the 1997 I-O estimates incorporated detailed data that had not been available for the NIPA estimates. As part of the incorporation into the NIPAs, the I-O estimates must be modified to account for the changes in definitions and classifications, such as the change that recognizes the implicit services provided by property and casualty insurance and the change that provides a more appropriate treatment of insured losses, as described in the June article.¹³

The incorporation of the 1997 benchmark I-O accounts will result in revisions to NIPA estimates for selected components, beginning with 1993; estimates from the 1992 benchmark I-O accounts were incorporated in the 1999 comprehensive revision of the NIPAs.

Other regular benchmark source data. This comprehensive revision will incorporate data on inventories, on the receipts and expenses of business establishments and of governments, on sales by detailed commodity and by merchandise line, on final industry and product shipments from the 1997 Economic Census, and on trade margins from both the 1997 Economic Census and the 1997 annual surveys of merchant wholesale and retail trade.¹⁴ The data on manufacturing, wholesale trade, and retail trade—which the

Census Bureau has also incorporated into the corresponding annual and monthly surveys—will affect the NIPA estimates of PCE for goods, of private fixed investment in equipment, and of the change in private inventories, beginning with 1993.

In addition, annual series that became available too late for the annual NIPA revisions in 2000, 2001, and 2002 will be incorporated. NIPA estimates that are based on the international transactions accounts (ITAs)—primarily net exports of goods and services and rest-of-the-world income receipts and payments—will be revised to reflect improvements to the ITAs that were introduced since 1999 and that affected years not covered by the annual NIPA revisions.¹⁵ Similarly, estimates of private structures will be revised to reflect Census Bureau revisions to the surveys of value-put-in-place data that go back to 1983.¹⁶ Other data that will be incorporated into the NIPAs include the following: Data on expenditures and receipts of state and local governments for fiscal years 1997–99 from the Census Bureau; final data on employer pension and profit-sharing plans for 1995–98 from the Department of Labor; revised data on mortgage debt outstanding beginning with 1982, and on consumer debt outstanding and the effective rate of interest on consumer debt outstanding beginning with 1980, from the Federal Reserve Board (FRB); and data for 1996 and 1999 nonfiler adjustments based on tabulations of IRS tax returns and new “exact-match” studies.¹⁷

Regular source data for 2000–2002

The revised estimates for 2000–2002 will reflect the incorporation of newly available and revised source data that became available since the last annual NIPA revision in July 2002. The most important of these data are the following: Census Bureau data from annual surveys of state and local governments (for fiscal years 2000 (final) and 2001 (preliminary)), of manufactures, of merchant wholesale trade, and of retail trade (for 2001 (preliminary) and 2000 (revised)); Census Bureau data from the services annual survey and from the

10. Benchmark years occur at about 5-year intervals. Quinquennial economic censuses are taken for these years, and benchmark estimates are prepared using data from these censuses.

11. For a discussion of the preliminary effects of the I-O accounts on the NIPA estimates for 1997, see McCulla and Moylan, 10–14.

12. See Ann M. Lawson, Kurt S. Bersani, Mahnaz Fahim-Nader, and Jiemin Guo, “Benchmark Input-Output Accounts of the United States, 1997,” *SURVEY* 82 (December 2002): 19–109.

13. Moulton and Seskin, 17–34.

14. In the 1999 comprehensive revision, preliminary retail sales data and product shipments for computers from the 1997 Economic Census were incorporated.

15. The annual revisions of the ITAs are usually published in the July issue of the *SURVEY*, most recently in Christopher L. Bach, “Annual Revision of the U.S. International Accounts, 1992–2002,” *SURVEY* 83 (July 2003): 32–45.

16. In 2000, the Census Bureau introduced significant revisions to selected value-put-in-place series: One-unit housing, residential improvements, and private industrial buildings. The revisions, which extended back to 1983, could not be incorporated fully in the 2000–2002 annual NIPA revisions. See U.S. Bureau of the Census, *Current Construction Reports—Value of New Construction Put in Place*, May 2000.

17. For information on previous nonfiler adjustments, see “Improved Estimates of the National Income and Product Accounts for 1959–94: Results of the Comprehensive Revision,” *SURVEY* 76 (January/February 1996): 24–25. The 1996 nonfiler adjustment was incorporated on a best-change basis in the 2001 annual NIPA revision.

surveys of the value of construction put-in-place for 2001–02; Federal Government budget data (for fiscal years 2002 and 2003); ITA data for 2000–2002 (revised); Bureau of Labor Statistics (BLS) tabulations of wages and salaries of employees covered by state unemployment insurance (UI) for 2001–02 (revised); newly available IRS tabulations of corporate tax returns for 2000 (final) and 2001 (preliminary); U.S. Department of Agriculture farm statistics (for 2002); and newly available IRS tabulations of sole proprietorship and partnership tax returns for 2001.¹⁸

Changes in Methodology

This section describes the new and improved methodologies that will be introduced as part of this comprehensive revision.¹⁹ The discussion includes changes to product- and income-side components, changes to price and quantity measures, changes to estimates of consumption of fixed capital, and extensions of several methodology changes that were incorporated in the 2000–2002 annual NIPA revisions.

Product-side changes

Motor vehicle output. Estimates of current-dollar and real motor vehicle output will reflect improved methodologies for net purchases of used motor vehicles and a new allocation between autos and trucks for the estimates of exports and imports in the motor vehicle output table. Net purchases of used motor vehicles by business, government, and persons consist of dealers' margins on used motor vehicles purchased and net transactions (purchases less sales) of used motor vehicles valued at wholesale prices. Dealers' margins affect GDP, but net transactions do not, because they represent changes in the ownership of previously produced goods.

The new method responds to user requests for more consistency between estimates of autos and light trucks, and it responds to the discontinuance of key source data that were used to prepare the auto estimates.

Dealers' margins. Beginning with 1993, BEA will change the method used to calculate annual estimates of dealers' margins. The dealers' margin for total light motor vehicles—autos and light trucks—will be computed for new (franchised) car dealers and for used (independent) car dealers, using data on used light motor vehicle sales, average retail prices, and used-car

dealers' margin rates.²⁰ For new-car dealers, retail sales of used light motor vehicles will be based on used-vehicle unit sales and used-vehicle average retail prices from a trade source; for used-car dealers, retail sales will be based on Census Bureau data for used-car dealer sales. Margin rates will be interpolated and extrapolated from the 1997 benchmark I-O estimates using the margin rates for used-car dealers as the indicator. The total margins will be allocated to used autos and to used light trucks using data on changes in used-vehicle registrations and average wholesale auction prices.²¹

Currently, autos are estimated independently from light trucks. For used light trucks, the new method will replace a judgmental estimate that assumed a lagged relationship between new-truck purchases and unit sales of used trucks, adjusted for price change. For used autos, the new method will replace a judgmental estimate based on trended sales of new-car dealers, retail prices of used autos sold at new-car dealers that were based on overall used-vehicle prices, and used-car margins of used-vehicle dealers based on overall margins of used-vehicle dealers.

Beginning with 1997, monthly and quarterly dealers' margins on used autos and on used light trucks will be interpolated and extrapolated using the change in used-vehicle registrations times the average auction price as the indicator.

The estimates of real margins for used autos and light trucks will be prepared by direct base-year valuation.²² New-car dealers' margins will be estimated using base-year average margin per light vehicle sold multiplied by unit sales of new-car dealers from a trade source. Used-car dealers' margins will be estimated using the base-year average margin per light vehicle sold multiplied by derived unit sales.²³ Total margins will be allocated to autos and to light trucks and to PCE and PFI using the current-dollar distribution. For used trucks, the new method will replace deflation with the BLS consumer price index (CPI) for new trucks for PCE and with a truck component of the producer price index (PPI) for new trucks for PFI. For used autos, the new method will replace a base-year valuation using judgmentally trended unit sales.

20. In this article, "light trucks" refers to the NIPA category "light trucks (including utility vehicles)," which includes pickup trucks, sport-utility vehicles, and vans.

21. A change in registration occurs when a used auto or a used light truck is registered with a new owner name and address. The changes are believed to be a reliable indicator of used-vehicle sales.

22. In direct base-year valuation, quantity indexes are derived by multiplying the base-year price by actual quantity data for the index period, then expressing the results as an index with the reference year equal to 100.

23. Unit sales are derived by dividing Census Bureau retail sales (less margins) by an average value based on average auction prices.

18. For a more detailed listing of the "regular" source data incorporated in an annual revision, see "Updated Summary NIPA Methodologies," SURVEY 82 (October 2002): 20–38.

19. These changes update the methodologies that are described in "Updated Summary NIPA Methodologies" and in the series of NIPA methodology papers.

Net transactions. Beginning with 1991, current-dollar net transactions in used autos and used light trucks by business and by government will be estimated directly by valuing the change in their unit stocks using vehicle average auction prices.²⁴ Net transactions by persons will be estimated as a residual, after accounting for the change in the value of stocks held by business and by government, exports and imports, scrappage, and change in dealers' inventories. In the current method for used autos' net transactions, the change in unit stocks is valued using indirectly measured wholesale values.²⁵ The current method for net transactions in used trucks is the same as that for dealers' margins on used trucks.

Estimates of real net transactions in light trucks will be prepared by deflating the current-dollar estimates using the CPI for used cars and trucks.²⁶ The new method will replace deflation with the CPI for new trucks for PCE and with a truck component of the PPI for new trucks for PFI.

As a result of these improvements, the motor vehicle output table will present estimates of used light trucks and of used autos for PCE, for PFI, and for the change in private inventories.²⁷ Currently, net purchases of used light trucks are not shown in this table.

Exports and imports. Beginning with 1985, estimates of exports and imports of autos and trucks will reflect classifications that are consistent with those used for estimates of PFI, government investment, change in private inventories, and PCE; passenger cars, including station wagons, will be classified as autos, and pickup trucks, vans, and sport-utility vehicles will be classified as trucks.²⁸ Currently, exports and imports of autos and trucks reflect Census Bureau end-use categories, which classify most vans and sport-utility vehicles as autos. Consistency between exports, imports, final sales, and change in private inventories of autos and trucks will improve the measures of truck output, auto output, and domestic output of new autos.

PCE for hotel and motel services. Annual estimates

24. Motor vehicles are grouped by age—determined by year of original sale—and the calculations are made by age group. Motor vehicle sales in a given year generally include sales from 3 model years: The model year corresponding to the previous calendar year; the model year corresponding to the current calendar year; and the model year corresponding to the next calendar year. For example, in 2001, vehicles were sold for model year 2000, model year 2001, and model year 2002.

25. These wholesale values are based on deflated new-car values adjusted for depreciation and restated to current dollars using the CPI for used vehicles.

26. Net transactions in used autos will continue to be deflated using the CPI for used cars and trucks.

27. See Mayerhauser, Smith, and Sullivan, 24.

28. Trucks consists of "light trucks" and "other trucks, buses, and truck trailers," which include medium-duty and heavy-duty trucks over 15,000 pounds.

of PCE for hotel and motel services will be improved. Beginning with 1990, the consumer share of lodging expenditures will be updated annually to reflect newly available trade-source data on U.S. residents' domestic lodging expenditures by sector, and the consumer shares for 1978–89 will be recomputed.²⁹ Currently, the consumer share is based on data for 1977 on overnight accommodations of U.S. residents for U.S. travel from the quinquennial National Travel Survey. After 1977, the National Travel Survey was discontinued, and because the consumer shares for 1972 and 1977 were about equal, the consumer share has been held constant since then.

In addition, spending by foreign visitors on lodging will be included for the first time using travel exports data from the ITAs. This change will provide consistency with the general treatment of expenditures by foreign visitors in the United States, which are included in the definition of PCE categories and are removed from total PCE as a deduction in net foreign travel.³⁰

PCE for prescription drugs. Beginning with 1997, monthly expenditures for prescription drugs will be estimated using data on retail sales of prescription drugs from a continuous trade-source survey of more than 20,000 retail pharmaceutical outlets. This improvement will make the monthly estimates of expenditures more comparable with the annual estimates of expenditures, which are based on the annual retail sales data from the trade source, beginning with 1998. Currently, the monthly expenditures are estimated using the CPI for prescription drugs prices and trended quantities. Prescription drugs continue to be a part of the "PCE control group," the value of which is not affected by this change.³¹ However, the independent estimate of prescription drugs affects the other

29. The consumer share represents the portion of total hotel and motel guestroom rentals that are purchased by U.S. consumers. Business, government, and foreign visitors are assumed to account for the remainder.

30. PCE measures total purchases of U.S. residents wherever the goods and services were produced. In the source data underlying many of the estimates of detailed PCE components, the expenditures of foreigners traveling in the United States are indistinguishable from those of U.S. residents. These outlays are removed in the aggregate from PCE and are shown instead as exports. Purchases abroad of goods and services by U.S. residents are included in total in the PCE category, "foreign travel and other, net" and are also shown as imports; these purchases are not distributed among the individual commodities in PCE.

31. The PCE control group consists of most PCE goods other than motor vehicles, school lunches, food furnished to employees (including military), food produced and consumed on farms, clothing issued to military personnel, and net foreign remittances. The PCE control group is estimated using Census Bureau data on retail sales to extrapolate an overall value. The commodity composition of the PCE control group is determined by merchandise-line allocations by kind of business on the basis of the 1997 Economic Census. See U.S. Bureau of Economic Analysis, *Personal Consumption Expenditures* (Washington, DC: U.S. Government Printing Office, June 1990): 41.

categories in the control group because it affects the commodity allocation of sales.³²

PCE for gasoline. Beginning with 1993, the monthly estimates of PCE for gasoline will be improved by preparing estimates for each of the three grades (regular, mid-grade, and premium). The estimates are prepared using seasonally adjusted quantities supplied and average prices for each grade. The independent estimate of PCE for gasoline, which is estimated as price times quantity, will remain in the PCE control group, the value of which is not affected by the change.³³ This new method will make the monthly estimation of expenditures for gasoline comparable with the annual estimation of expenditures by accounting for changes that occur in the mix of gasoline by grade on a monthly basis.

Nonprofit institutions serving households. In the NIPAs, the personal sector comprises households and nonprofit institutions serving households (NPISHs). As part of the comprehensive revision, BEA plans to introduce a new annual table that separates the income and outlays of households from those of NPISHs; this information can be used to answer questions about differences in economic behavior of households and nonprofit institutions in the U.S. economy. These estimates will reflect the introduction of additional data sources and methods to separately identify households from NPISHs.³⁴ The primary data sources used for the NIPAs do not currently provide separate measures for all the income and outlays of NPISHs. For example, there are no separate measures of the property income of NPISHs and the property income of households.

Residential improvements. Estimates of residential improvements, a component of residential structures, will be revised to incorporate a moving-average methodology that will dampen the volatility in the source data. Currently, the NIPA benchmark, annual, and quarterly estimates are based on Census Bureau surveys of value-put-in-place residential improvements. In recent years, the Census Bureau series has shown considerable volatility because the permissible upper-bound values for projects that were included in the survey sample have been increased periodically.

For the annual estimates beginning with 1987, BEA will adopt the following methodology. The 1997

benchmark estimate, which is equal to the Census Bureau value, will be extrapolated forward to 2002 and backward to 1987 using a weighted 3-year moving average of the Census Bureau series.³⁵ The annual estimates for the most recent year (2002) will be based on the new moving-average methodology, with the value for that year estimated by BEA on a trend basis. Currently, the NIPA series is extrapolated using the Census Bureau improvements series as the indicator.

Software. The following improvements to the measurement of computer software that were incorporated into the 1997 I-O accounts will be incorporated into the NIPAs. Software originals used for reproduction were capitalized, more detailed occupational data were used in estimating own-account software by industry, the total costs of producing own-account software were calculated more directly, the estimates of intermediate consumption of software (embedded or bundled with other equipment) were improved, and the coverage of international trade in software was expanded.³⁶

Enterprise equipment investment. Estimates of investment in Federal Government enterprise equipment, which are included in Federal Government non-defense gross investment, will be improved. Beginning with 1993, judgmental estimates of enterprise equipment will be replaced with estimates based on Federal budget data. For consistency, BEA will reconcile the enterprise equipment investment data from the Federal budget with the enterprise equipment investment data that are published in the annual reports of Federal enterprises, which are used to calculate the Federal current surplus of government enterprises. As part of this change, data on investment in computers from the U.S. Postal Service, which is a Federal Government enterprise, will be used to supplement the budget data.

Income-side changes

Income and employment by industry. The annual estimates of income and employment by industry will be converted to the 1997 North American Industry Classification (NAICS) basis from the 1987 Standard Industrial Classification (SIC) basis, beginning with 1998, and the quarterly estimates will be presented on a NAICS basis, beginning with 2001. Through 2000, the annual and quarterly estimates will continue to be presented on an SIC basis. The August SURVEY article described the new table stubs for the estimates of income and employment.³⁷

32. Under the new treatment, the value of the drugs is removed from the control group before the commodity composition of the remainder of the group is determined.

33. The treatment of gasoline within the PCE control group is similar to the treatment of prescription drugs; see footnote 32.

34. Preliminary estimates for 1992–2001 were presented in Charles Ian Mead, Clinton P. McCully, and Marshall B. Reinsdorf, "Income and Outlays of Households and of Nonprofit Institutions Serving Households," SURVEY 83 (April 2003): 13–17.

35. The weights for the 3-year moving average are 50 percent for year t and 25 percent each for years $t-1$ and $t+1$.

36. See Lawson et al., "Benchmark Input-Output Accounts," 26–28.

37. Mayerhauser, Smith, and Sullivan, 22–24.

Employee stock options. A stock-options adjustment will be made to corporate profits estimates for the most recent year of an annual NIPA revision (2002 for this benchmark revision) in order to offset a timing problem between the treatment of nonqualified stock options (NSOs) in reported wages and salaries and the exercise of these options in the corporate profits data.³⁸ In the NIPAs, when an NSO is exercised, the difference between the exercise price and the current market price of the stock is treated as wages and, therefore, as an expense in measuring corporate profits.

The NIPA treatment of employee stock options is based on the treatment of stock options in the administrative source data that are currently used to estimate the wages and salaries and the corporate profits components of gross domestic income. BLS tabulations of UI data provide the key source data for BEA's annual and quarterly estimates of wages and salaries. These tabulations generally include the employee exercise of NSOs, but they are not separately identified. Tabulations of Federal corporate income tax returns from the IRS SOI program provide the key source data for BEA's annual detailed industry estimates of corporate profits. These tabulations are net of the expense of NSO stock-option exercises, which are separately recorded on Schedule M-1, a supporting form to IRS Form 1120 for corporate tax returns.

Although companies take a tax deduction for the exercising of these options, the expensing of exercised stock options is not typically reflected in their public financial reports.³⁹ Thus, for time periods for which the estimates of corporate profits are extrapolated using the data on profits from the public financial reports, the exercising of NSOs measured in wages and salaries are not offset correctly in corporate profits.

To correct this reporting mismatch, BEA will incorporate a stock-options adjustment to corporate profits for the periods that are estimated using public financial reports. For example, in the NIPA estimates that will be released at the end of this year, the extrapolated corporate profits estimates for 2002 and 2003 will be adjusted for exercised stock options. Because the gains on exercised stock options declined from 2001 to 2002, this adjustment will increase BEA's estimate of corporate profits for 2002 from what it would otherwise have been.

The adjustment to the annual estimates of corporate

38. For details on NSOs and the NIPAs, see Carol E. Moylan, "Treatment of Employee Stock Options in the U.S. National Economic Accounts" (paper presented at the Organisation for Economic Cooperation and Development Meeting of National Accounts Experts, Paris, September 26-29, 2000); <www.bea.gov/bea/papers/empstop.pdf>.

39. However, a growing number of firms are starting to include information about the expensing of the fair value of newly granted stock options in their public financial reports.

profits will be based on an ongoing BEA study to measure the gains on exercised stock options. Estimates from this study have been developed using a matched sample of approximately 100 firms that account for approximately 70 percent of the stock-option activity of the S&P 500 corporations.⁴⁰ When the SOI data become available for a particular year, this adjustment will no longer be needed for that year.

Employer contributions to pension and profit-sharing plans. Two adjustments will be removed from employer contributions for private pension and profit-sharing plans—a component of employer contributions for employee pension and insurance funds—in order to measure these contributions on an accrual basis rather than on a cash basis.⁴¹ In addition, new adjustments to the source data will be introduced to improve the estimates of these contributions.

The Department of Labor Employee Benefits Security Administration tabulates employer contributions to both defined-benefit plans and defined-contribution plans for private pension and profit-sharing plans (Form 5500). BEA adjusts these data for timing and for coverage. Under the new methodology, two timing adjustments will be removed in order to measure these contributions on an accrual basis rather than on a cash basis. Currently, BEA assumes that most employers defer contributions until the end of their fiscal years, so BEA makes an adjustment that shifts the contributions of firms with fiscal years that begin in the second half of a calendar year to the next calendar year. By dropping this adjustment, these contributions will be shown in the calendar year in which the fiscal year of the plan begins. Currently, BEA also adjusts for the timing of accounts receivable because plan administrators report the amount of contributions owed, but not paid, during the plan year. To make the contributions net of receivables, BEA assumes that these receivables are paid during the following year. On an accrual basis, this adjustment will no longer be necessary.

The coverage adjustment for contributions to multi-employee Keogh-type plans will be improved, and new adjustments will be added for the contributions to simplified employee pension plans (SEPs) and to sav-

40. In the notes to their annual financial statements, corporations are required to disclose information on their stock-option activity for the most recent 3 fiscal years. This information includes the number of options outstanding at the beginning of the year, the number granted, the number exercised, the number canceled, and the number outstanding at the end of the year. Corporations are required to disclose the weighted-average exercise price for each category, but they are not required to disclose the weighted-average market price at exercise.

41. Ideally, for accrual estimates, it would be appropriate to incorporate a timing adjustment based on the starting date of the plan's fiscal year. However, over 80 percent of the plans have fiscal years beginning on January 1, and BEA does not have the resources to reprocess the Form 5500 data to implement this adjustment.

ing incentive match plans for employees of small employers (SIMPLEs).⁴² Multiemployer Keogh-type plans include employer contributions for both the proprietors and the employees, but they cannot be separately identified. BEA treats contributions to the proprietors' plan as part of proprietors' income, so these contributions must be subtracted from total employer contributions. Currently, on the basis of a small one-time study of sample 1987 SOI data, BEA subtracts 50 percent of the contributions to multiemployer Keogh-type plans as contributions for proprietors' plans. Based on a new SOI study for 1997–99, BEA will lower this percentage to 25 percent.

Contributions to SEPs and SIMPLEs are not included in the Form 5500 tabulations and must be added to total employer contributions.⁴³ BEA will add an adjustment for the employer contributions to these plans using SOI information that is available beginning with 1997. Estimates for employee SEP plans will be extrapolated back to 1978. Currently, BEA makes no adjustment for employee SEPs and SIMPLEs.

BEA will continue to make a 401(k)-type plan misreporting adjustment to correct for employee contributions that are included as part of employer contributions to private pension plans. Until the mid-1990s, the Form 5500 instructions did not specify how these contributions should be reported. BEA has determined that several plans are still reporting both employer and employee contributions.

Employer contributions for health insurance. Beginning with 1987, estimates of employer contributions for group health insurance, which accounts for about half of employer contributions for employee pension and insurance funds, and estimates of PCE for health insurance will be improved.⁴⁴ For 1996–2001, the estimates will reflect the following: Annual growth rates for total employer contributions to private plans that will be based on the growth rates for total private plans from the annual medical expenditure panel survey (MEPS), an adjustment to the MEPS data to better capture family-plan health insurance costs, and the removal of a 1996–97 discontinuity in BEA's published estimates for employer contributions to group health insurance.

In 1999, the Department of Health and Human Ser-

vices released the results of the MEPS for 1996 that provided a benchmark for the level of employer health insurance costs by industry.⁴⁵ MEPS covers both health insurance purchased by employers for their employees and health insurance provided by employers on a self-insured basis.

In the 2000 annual NIPA revision, BEA incorporated MEPS-based estimates on a "best-level" basis for 1997, which resulted in a roughly \$20 billion discontinuity between the 1996 and the 1997 published estimates of employer contributions to group health insurance and a smaller discontinuity in the estimates of PCE.⁴⁶ The MEPS-based annual growth rates were not incorporated into the estimates for 1998 forward, because a sufficient time series was not available to assess the quality and reliability of the estimates. Instead, the estimates for later years were extrapolated using BLS data on employer costs for employee compensation (ECEC) and BLS tabulations of wages and salaries of employees covered by UI.⁴⁷

The MEPS-based estimates for 1996–2000 will be adjusted to incorporate an improvement to the 2001 MEPS, which now provides a better measure of the value of employer contributions for family-plan health insurance. For 1996–2000, MEPS provided data on the costs of employer contributions for enrollees with single coverage and for enrollees with family coverage. If a plan offered more than one arrangement for family coverage, employers were required to report the costs of coverage based on the plan for a family of four, which did not accurately represent the actual costs or growth pattern of family coverage. Beginning with the 2001 MEPS, the cost of family coverage is shown for a two-person family (husband and wife or single parent and one child) and for a family of four. This survey change resulted in a substantial drop in the estimates of the total cost of family coverage. The 2001 MEPS showed rapid growth in two-person family coverage from 2000 to 2001. Consequently, the MEPS annual growth rate for previous years will be revised down to produce a consistent time series.

After adjusting for two-person family coverage, the MEPS all-industry annual growth rate will be used for total employer contributions to private plans. The sample size for MEPS is too small to use for estimates

42. Small employers are firms with less than 100 employees.

43. SEP plans began in 1978, and SIMPLE plans began in 1997.

44. Employer contributions for employee pension and insurance funds, formerly "other labor income," will consist of employer payments (including payments-in-kind) to private pension and profit-sharing plans, publicly administered government employee retirement plans, private group health and life insurance plans, privately administered workers' compensation plans, and supplemental unemployment benefit plans. Miscellaneous compensation of employees will be reclassified as wages and salaries, as noted in Mayerhauser, Smith, and Sullivan, 12–13.

45. MEPS, an annual survey of about 50,000 respondents, provides estimates of the direct expenditures by employers for health insurance for their employees.

46. For the 2000 annual revision, 1997 was the earliest year open to revision. For more information on the implementation of MEPS in the 2000 annual revision, see Eugene P. Seskin and David F. Sullivan, "Annual Revision of the National Income and Product Accounts," *SURVEY 80* (August 2000): 28.

47. The ECEC—a quarterly survey of around 4,000 respondents—provides the cost of health insurance as a percentage of wages.

by industry, which will continue to be calculated using ECEC industry data and industry wage tabulations. To remove the discontinuity between 1996 and 1997, the MEPS-based estimates will be extended back to 1987 using ECEC data and BLS tabulations of UI wages and salaries.

In addition, beginning with 2002, quarterly estimates of private employer contributions for group health insurance will be based on newly available quarterly ECEC data and BLS tabulations of UI wages and salaries. Currently, these estimates are based on a judgmental trend.

Federal Government health insurance. Beginning with 1993, quarterly estimates of Federal employer contributions for health insurance, a component of employer contributions for employee pension and insurance funds, will be improved by interpolating annual estimates of these contributions from the Office of Personal Management (OPM) using the trend in OPM data on Federal employment as an indicator.⁴⁸ Currently, estimates of Federal wages and salaries are used to interpolate this series. These wage and salary estimates include a number of special factors—such as pay raises, the wages and salaries of temporary workers who may not receive health insurance coverage, buyouts, and overtime pay—that are not directly related to Federal employer contributions for employee health insurance. Thus, the new method is expected to produce quarterly estimates that are more representative of these employer contributions.

Partnership income. An adjustment to nonfarm proprietors' income that removes a double-counting of the income remitted by other partnerships will be improved. In SOI tabulations of partnership income, net income received from other partnerships is counted twice—once by the receiving partnership and again by the remitting partnership. Currently, in the calculation of nonfarm proprietors' income, SOI partnership income is reduced by the ordinary income from other partnerships less the ordinary loss from other partnerships to eliminate double counting. However, no adjustment is made to account for other types of income received by partnerships from other partnerships, including guaranteed payments to partners, portfolio interest, real estate rental income, and net income from other rental activity. Beginning with 1987, the adjustment to account for the double-counting of partnership income received from other partnerships will take into account these other types of income.

48. Annual estimates of Federal employer contributions for health insurance will not be affected by this change.

Portfolio interest. The estimates of nonfarm proprietors' income and of net interest will reflect a change to fully incorporate portfolio interest received by financial partnerships.⁴⁹ Currently, estimates for these components do not fully reflect SOI-based source data on portfolio interest that are available from Schedule K, a supporting form to IRS Form 1065 for partnership tax returns.

The Tax Reform Act of 1986 resulted in several tax reporting changes for partnerships, one of which was the move of portfolio interest income of partnerships from Form 1065 to Schedule K. BEA did not recognize at the time that the SOI category of "other holding companies" comprises establishments engaged in financial activities and that the interest received by these establishments should be included in nonfarm proprietors' income. Consequently, beginning with 1987, nonfarm proprietors' income was understated.⁵⁰ For net interest, the data from Schedule K will replace an indirect extrapolation.

Imputed interest. The revised estimates of net interest will reflect a change in the source data used for estimating imputed interest paid by life insurance carriers. These carriers earn investment income on policyholders' reserves, and an interest imputation is made to pass this investment income through to persons as it is earned.⁵¹ Beginning with 1977, the imputation for monetary interest, dividends, net rent, and royalties earned on policyholders' reserves will be estimated using investment income reported by the American Council of Life Insurance (ACLI).⁵²

Currently, the portion of the imputation related to dividends, net rent, and royalties earned on policyholders' reserves is based on IRS tabulations of corporate income tax returns for life insurance companies

49. In the NIPAs, portfolio interest income received by financial partnerships is considered to be related to the business operation and is included in "income receipts on assets" and, thus, in nonfarm proprietors' income and in the calculation of net interest; in contrast, portfolio interest income received by nonfinancial partnerships is considered to be unrelated to the business operation and is excluded from nonfarm proprietors' income and from the calculation of net interest.

50. For 1986 and earlier years, portfolio interest was included in total receipts as an item on Form 1065, and it was subtracted from the income of nonfinancial partnerships; no adjustment was needed to financial partnerships. Beginning with 1987, because portfolio interest was no longer included in total receipts, it was no longer necessary to subtract this interest from the income of nonfinancial partnerships, but it was necessary to add this interest to the income of financial partnerships.

51. This imputation consists of the monetary interest, dividends, net rent, and royalties earned on policyholders' reserves, plus imputed interest received on life insurance carriers' deposits with commercial banks and investment companies, less profits of mutual life insurance companies.

52. The SOI data remain the source for the net interest components of monetary payments and receipts for the life insurance industry in order to be consistent with the SOI-based NIPA estimates of monetary interest payments and receipts of other industries.

from the SOI program. Beginning with 1990, the portion of the imputation related to monetary interest is based on interest receipts from tabulations of income statements for life insurance carriers prepared by the ACLI; this portion will now be carried back to 1977.⁵³

The use of ACLI data on investment income is preferable to the use of IRS data. ACLI investment income, compiled from regulatory filings of life insurance companies with state agencies, covers only life insurance operations, whereas the SOI life insurance industry data, which are from consolidated tax returns, are affected by changes in the industry classification of enterprises that have both life insurance and nonlife insurance operations.⁵⁴

State and local current taxes. Beginning with 1988, the Census Bureau's *Government Finances (GF)* survey will become the primary source for all annual estimates of state and local current taxes, a receipt within the government receipts and expenditure account. BEA considers the *GF* tax data to be more accurate than the tax data available from the Census Bureau's *Quarterly Summary of State and Local Government Tax Revenue (QS)*, which is the current source for several state and local tax series. The adoption of *GF* as the primary source for tax data will result in greater internal consistency for the estimates of state and local receipts and expenditures because most of the expenditure estimates are derived from *GF*.

The new methodology for estimating state and local current taxes will have three steps. First, categories of *GF* taxes will be compared with tax collections series from the *QS* and from the Nelson A. Rockefeller Institute of Government's *State Revenue Report (SRR)*. The series that is most closely related on the basis of estimates of coefficients of determination will be used for interpolation and extrapolation.⁵⁵ Second, quarterly interpolations of the *GF* fiscal year data will be prepared using the matched *QS* or *SRR* series as indicators. Third, calendar year *GF*-based tax estimates will be calculated by averaging the interpolated fiscal year quarters. Preliminary annual estimates for 1988–99 indicated that this procedure generated revisions to total state and local current taxes that did not exceed \$7.0 billion in absolute value.

53. For further details on the earlier methodology change for monetary interest, see "Annual Revision of the U.S. National Income and Product Accounts," *SURVEY 73* (August 1993): 29.

54. In the IRS data, some life insurance carriers are classified in the casualty insurance industry and others are classified in industries not related to insurance, because the IRS information is based on the filing of consolidated tax returns.

55. Coefficients of determination—also known as R^2 s—are statistical indicators of the strength of the relationship between variables.

Quarterly estimates will be prepared by interpolation using as indicators the matched *QS* and *SRR* data, seasonally adjusted by BEA. Current quarterly estimates will be prepared by extrapolating seasonally adjusted quarterly data from the *QS* and *SRR*. Monthly estimates will be prepared by interpolating quarterly estimates without an indicator. Estimates of personal current taxes for the most recent months will continue to be prepared by extrapolation using wage and salary disbursements.

Federal Medicare social benefits. Estimates of Federal Government Medicare social benefits (formerly Medicare transfer payments)—a current transfer payment within the government receipts and expenditures account—will be converted from a cash-accounting basis to an accrual-accounting basis.⁵⁶ Under the new method, the source for the annual estimates of Medicare social benefits for all but the 2 most recent years will be the Centers for Medicare and Medicaid Services (CMS), which prepares these estimates on an "incurred" or accrual basis. Currently, the NIPA estimates of Medicare social benefits are based on Monthly Treasury Statement (MTS) and Federal budget data, which are on a cash-accounting basis. The annual accrual-based CMS estimates will be incorporated beginning with 1967, and the quarterly and monthly NIPA estimates will be prepared by interpolation without an indicator.

Because the CMS estimates of Medicare social benefits for the most recent 2 years are subject to large revisions, the NIPA estimates for these years will continue to be based on MTS data. In addition, the current quarterly and monthly estimates will continue to be based primarily on interpolations of fiscal year Federal budget projections without an indicator.

State and local Medicaid social benefits. The current quarterly and monthly estimates of Medicaid social benefits (formerly Medicaid transfer payments)—a current transfer payment within the government receipts and expenditures account—will be improved.⁵⁷ The revised estimates will be based on data on Federal Medicaid grants to states from the MTS, adjusted to account for timing differences in billings and payments.⁵⁸ The parameters that will be used to adjust the MTS data for these differences were derived from a regression model of quarterly CMS Medicaid

56. Medicare social benefits also appear in the personal income and outlay account.

57. Medicaid social benefits also appear in the personal income and outlay account.

58. Timing differences are defined as the differences between the CMS Medicaid social benefits data and the MTS Medicaid grants data.

transfer payments for period t on two independent variables: Federal Medicaid grants for period t and a variable representing the difference between CMS Medicaid transfer payments and MTS Medicaid grants in period $t-1$.⁵⁹

The current quarterly and monthly estimates of state and local government Medicaid social benefits are now based on interpolations of annual projections developed from forecasts of Medicaid social benefits by CMS, the Congressional Budget Office, and others.

Quantities and prices

Most current-dollar NIPA estimates are based on source data that represent the value of market transactions in current prices. To remove the effects of price change from the value of these transactions—that is, to measure real economic activity—BEA relies heavily on price and quantity indexes.⁶⁰ In comprehensive revisions, BEA introduces changes that produce updated, new, and improved real NIPA estimates. As part of this comprehensive revision, the following changes will be introduced: The incorporation of an improved composite deflator for PCE for medical care and hospitalization insurance benefits, the introduction of new supplemental market-based PCE price and quantity measures, a modification to the price index used to deflate change in farm inventories, the development of new hedonic price indexes by BEA for private and government investment in nonresidential structures and equipment, and the incorporation of newly available PPIs from BLS into the estimates of real Federal Government consumption expenditures.

New price index for PCE for medical care and hospitalization insurance benefits. Beginning with 1988, the annual composite index that is used to deflate PCE for medical care and hospitalization insurance benefits will be improved. The new annual price index will be a weighted average of CPIs and PPIs for eight types of care. The weights will be based on estimates of private insurance benefits by type of care from CMS. The additional detail enables the benefit deflators to be more closely matched to the types of benefits. The new index will account for changes over time in private

insurance payments by type of care and for all types of care. Currently, the annual price index is a fixed-weighted average of the CPI for hospital and related services and the CPI for physicians' services.

Beginning with 1994, the monthly deflator for these benefits will be based on interpolation and extrapolation of the weighted average of the PPIs for general medical and surgical hospitals and for offices of physicians. For earlier years, the monthly deflator will continue to be a fixed-weighted average of the CPI for hospital and related services and the CPI for physicians' services.

Market-based PCE prices and quantities. New supplemental PCE price and quantity indexes that are based on market transactions for which there are corresponding price measures will be introduced. Specifically, the price index will provide a measure of the prices paid by persons for domestic purchases of goods and services, which may be a useful measure of consumer prices for some analytical purposes. The index will be composed of PCE components that are deflated by either a detailed CPI or a PPI. It will exclude expenses of nonprofit institutions serving households, most insurance purchases, gambling, margins on used light motor vehicles, expenditures by U.S. residents working and traveling abroad, and imputed expenditures other than owner-occupied nonfarm housing.⁶¹

Two price indexes will be prepared: An overall market-based PCE measure and a market-based PCE measure that excludes food and energy. Current-dollar estimates, chained (2000) dollar estimates, and chained-type price and quantity indexes will be shown as addenda items in the underlying detail PCE tables on BEA's Web site.⁶²

New price index for change in farm inventories. Beginning with 1977, the quarterly composite index of crop prices that is used to calculate real change in private inventories for farm crops will be improved. In order to more accurately reflect the composition of crop inventories, the new index will exclude the prices of fruits, vegetables, and other perishable crops. Currently, the quarterly composite index of crop prices is calculated by weighting the quarterly market prices of

59. The model's variables were constructed on a percent-change basis using data from the first quarter of 1991 through the first quarter of 2002. The coefficient of determination for the regression model is 0.82; the coefficients for the Medicaid grants variable and for the timing difference variable are 1.059 and -0.638, respectively. Both coefficients had p-values of less than 0.001.

60. For more details on preparing real NIPA estimates, see U.S. Bureau of Economic Analysis, *National Income and Product Accounts of the United States, 1929-97: Volume 1* (Washington, DC: U.S. Government Printing Office, September 2001): M-14—M-19.

61. Household insurance premiums, which is deflated by the CPI for tenants' and household insurance, will be included in market-based PCE; medical and hospitalization and income loss insurance, expense of handling life insurance, motor vehicle insurance, and workers' compensation will be excluded.

62. Go to <www.bea.gov>, click on "Gross Domestic Product" under "National," scroll down and click on "NIPA underlying detail and key source data tables," and then click on "Historical underlying detail files for personal consumption expenditures."

all crops reported by the Department of Agriculture on the basis of the composition of annual real open market sales of crops.

New price indexes for selected types of nonresidential structures. The absence of quality-adjusted, directly measured, output price indexes for preparing real estimates of investment in nonresidential structures has been a persistent shortcoming in the NIPAs. Currently, to deflate nonresidential buildings, BEA uses an indirect index that is an unweighted average of the Census Bureau price index for single-family houses under construction and a three-quarter moving average of the Turner Construction Company's building-cost index.⁶³

BLS has initiated a research program on construction output price indexes and plans to begin publishing PPIs for warehouses, light industrial and factory buildings, office buildings, and schools within the next few years.

BEA has conducted research on construction price indexes intermittently over several decades.⁶⁴ Recently, BEA has produced cost-based price indexes for selected types of nonresidential buildings. Although the new indexes are cost based rather than output based, they represent a better match of costs to building types than the current indirect index, so they will be used for deflating nonresidential buildings in the comprehensive revision. BEA will link the new indexes to BLS construction PPIs when they become available.

BEA will introduce annual price indexes for four building types—warehouses, factories, office buildings, and schools; these indexes are derived using ordinary least squares hedonic regressions, and they therefore embody adjustments for quality change.⁶⁵ The specific model is a regression of the natural logarithm of the cost per square foot on the following independent variables: The natural logarithm of the total square feet excluding the basement; dummy variables

for the six possible combinations of exterior wall and interior supporting-frame type; and a dummy variable for the year.⁶⁶

The data used to estimate the regressions were from R.S. Means Company's *Square Foot Costs* for 1997 and 1999–2003.⁶⁷ Separate regressions were estimated for the four building types, for building types with and without basements, and for selected building types by height class.⁶⁸ All regression coefficients had p-values of less than 0.001 and the appropriate signs.

Consistent with standard practice, coefficient estimates for the constant term and for the year dummy variables were used to construct price indexes for the four building types, which were then weighted together judgmentally to produce the final indexes for the four building types for 1997 and for 1999–2003.⁶⁹ For 1998, the R.S. Means national 30-city average price index was used to interpolate the new BEA price indexes between 1997 and 1999.

Because the cost data used in the regressions represented costs at the beginning of a year, BEA averaged adjacent-year indexes that were derived from the regressions. Quarterly indexes were prepared by interpolating the annual indexes using the current indirect index as an indicator.

BEA will use the newly developed construction price indexes to deflate related structure types for private nonresidential structures and for Federal Govern-

63. The Turner Construction Company's building-cost index, which represents changes in the cost of constructing nonresidential buildings, is intended to capture changes in the costs associated with constructing large nonresidential buildings, such as office and industrial buildings, hospitals, and hotels. The Census Bureau price index for single-family houses under construction is intended to capture changes in costs associated with constructing smaller nonresidential buildings, such as commercial buildings (restaurants, gasoline service stations, and shopping centers) and religious buildings.

64. For example, see "Revised Deflators for New Construction," *SURVEY* 54 (August 1974): 18–27; Frank de Leeuw, "New Price Indexes for Construction" (discussion paper no. 50, Washington, DC: U.S. Bureau of Economic Analysis, June 1991); Frank de Leeuw, "Price Indexes Based on the Dodge Major Project File," (discussion paper no. 51, Washington, DC: U.S. Bureau of Economic Analysis, June 1991); and Frank de Leeuw, "A Price Index for New Multifamily Housing," *SURVEY* 73 (February 1993): 33–42.

65. For details on the use of hedonics in the NIPAs, see David W. Cartwright, "Improved Deflation of Purchases of Computers," *SURVEY* 66 (March 1986): 7–9; R. Cole, Y. C. Chen, J. Barquin-Stolleman, E. Dullberger, N. Helvacian, and J. H. Hodge, "Quality-Adjusted Price Indexes for Computer Processors and Selected Peripheral Equipment," *SURVEY* 66 (January 1986): 41–50; Jack E. Triplett, "The Economic Interpretation of Hedonic Models," *SURVEY* 66 (January 1986): 36–40; Bruce T. Grimm, "Price Indexes for Selected Semiconductors, 1974–96," *SURVEY* 78 (February 1998): 8–24; and J. Steven Landefeld and Bruce T. Grimm, "A Note on the Impact of Hedonics and Computers on Real GDP," *SURVEY* 82 (December 2000): 17–22.

66. The data sets for each of the four types of buildings were pooled time-series cross-sectional observations for 6 years (1997 and 1999–2003). Depending on the building type, the hedonic regressions included from three to five quality-characteristic dummy variables. In addition, separate regressions were estimated for each height class.

67. Data for 1998 were not available. A minimum of 648 observations were available for pooled regressions for 1997 and 1999–2003 for warehouses, factories, office buildings, and four types of schools.

68. There were two height classes for factories and three height classes for office buildings.

69. The methodology used to construct price indexes for schools differed slightly. Separate hedonic regressions were calculated for four types of school buildings—elementary, junior high, high, and vocational—on a with- and without-basement basis. The price indexes derived from the with- and without-basement regressions were weighted together using unpublished data from the Census Bureau to form subindexes by school type. The school-type subindexes were weighted together to form a summary index for schools using Census Bureau data on school enrollment by age and assuming that vocational school enrollment was equal to 20 percent of high school enrollment.

ment and state and local government gross investment in structures. Table 2 provides details on how the new price indexes will be matched with structure types for deflation purposes.

New price index for photocopying equipment. BLS introduced a PPI for photocopying equipment in 1993, but this index has only been available sporadically. Consequently, BEA undertook research to fill the gap using 1992–2002 trade-source data and a biennial hedonic regression model in which the natural logarithm of the price of a model of photocopying equipment is regressed on the following independent variables: The natural logarithm of the multicopy speed; quality-characteristic dummy variables for color, capability, multifunctionality, and capacity; and a time dummy variable that takes on the value 1 if the *i*th photocopy model was sold in the second year of the biennial regression data sets.⁷⁰

The nine biennial regressions averaged over 200 observations each; they produced coefficients of determination that averaged 0.84, and they yielded highly significant p-values for the estimated coefficients. BEA used the antilog of the time dummy coefficients to construct price indexes for 1992–2001. The price indexes for periods after 2001 are prepared by extrapolation using the BLS PPI for photographic equipment and supplies with a BEA adjustment. The new BEA price index for photocopying equipment, which declines 7.2 percent at an average annual rate in 1992–2002, will be used to deflate annual estimates of both domestic and imported photocopying equipment. Quarterly estimates will be prepared by interpolation using the PPI for photographic equipment and supplies as an indicator.

Currently, real estimates of photocopying equipment, which is included in private equipment and software, are prepared by deflation using a related BLS PPI. Real estimates of imports of photocopying equipment, which is included in the business machinery and equipment end-use category, are prepared by deflation

70. The biennial regression technique allows for changes in products and for changes in the composition of products sold.

using the BLS international price index (IPI) for that category.

New price index for own-account software. BEA will incorporate a new price index for own-account investment in software that will reflect productivity changes. Currently, the price index for own-account software investment is calculated from a weighted average of compensation rates for computer programmers and systems analysts and the costs of intermediate inputs associated with their work; it assumes no changes in productivity over time.⁷¹

Beginning with 1998, the new price index will be constructed as a weighted average of the percentage changes in the current input-cost index (75-percent weight) and the BLS PPI for “prepackaged software applications sold separately” (25-percent weight), which reflects changes in productivity.⁷² For 1959–97, the price index will be constructed as a weighted average of the percentage changes in the improved input-cost index (75-percent weight) and the BEA prepackaged software price index (25-percent weight), which also reflects productivity changes. Quarterly indexes will be prepared by interpolation; the input-cost subcomponent will be interpolated using related BLS employment cost indexes and PPIs as indicators, and the prepackaged software subcomponent will be interpolated using the related PPI as an indicator.

The new price index, which shows a slower average annual growth rate for 1959–2002 (0.6 percent) than

71. For information on BEA’s price index for own-account software see Eugene P. Seskin, “Improved Estimates of the National Income and Product Accounts for 1959–98: Results of the Comprehensive Revision,” *SURVEY* 79 (December 1999): 37–39; Robert P. Parker and Bruce T. Grimm, “Recognition of Business and Government Expenditures for Software as Investment: Methodology and Quantitative Impacts, 1959–98” (paper presented at the May 5, 2000, meeting of the BEA Advisory Committee, Washington, DC, <www.bea.gov/bea/papers/software.pdf>); and Bruce T. Grimm, Brent R. Moulton, and David B. Wasshausen, “Information Processing Equipment and Software in the National Accounts” (paper prepared for the Conference on Measuring Capital in the New Economy, sponsored by the NBER/CRIW, April 26–27, 2002, at the Federal Reserve Board, Washington, DC, <www.bea.gov/bea/papers/IP-NIPA.pdf>).

72. The input-cost index will also be improved. National median wage rates that are calculated from current population statistics will be replaced by mean wage rates calculated from detailed BLS occupation-employment statistics.

Table 2. New Construction Price Indexes Used to Deflate Private, Federal, and State and Local Structures

New construction price indexes	Private nonresidential structure types (5.4.B) ¹	Federal structure types (5.8.B)	State and local structure types (5.8.B)
Warehouses	Food and beverage; multimerchandise shopping; warehouse and other commercial
Factories	Manufacturing	“Other” manufacturing	“Other” manufacturing
Office buildings	Office	Office	Office
Schools	Educational	Educational	Educational

¹ The numbers in parentheses represent NIPA table groups in which the structure types will appear.

the published price index (4.0 percent), will be incorporated beginning with 1959. It will be used to deflate investment in own-account software in private equipment and software and in Federal Government and state and local government gross investment in equipment and software.⁷³

New prices for Federal Government consumption expenditures. Newly available PPIs will replace indexes of average hourly earnings (AHEs) as deflators for two categories of Federal Government nondefense services. First, beginning with the fourth quarter of 1998, Federal Housing Administration (FHA) sales of services will be deflated using an index derived as a weighted average of PPIs for real estate agents and managers (10-percent weight) and surety and financial guaranty insurance (90-percent weight). Currently, FHA sales of services is deflated using an index of AHEs for insurance services.

Second, beginning with the first quarter of 1997, sales of nondefense “other” services will be deflated using an index derived as the weighted average of PPIs for accounting, auditing, and bookkeeping services and for engineering design, analysis, and consulting services. The weights used to combine the PPIs were derived from the current-dollar value of the transactions in these service categories. Currently, sales of nondefense “other” services is deflated using an index derived as a weighted average of AHEs for business services, for miscellaneous repair services, and for engineer and management services.

Changes to estimates of consumption of fixed capital

Three key statistical changes will be incorporated into the NIPA estimates of private consumption of fixed capital (CFC): New expected service lives will be adopted for private aircraft; CFC for light trucks will be estimated separately for the first time; and the estimates of autos will reflect a revised depreciation schedule. These changes will be reflected in the aggregate CFC estimates for corporate profits and nonfarm proprietors’ income.

Aircraft. Recent research at BEA indicated that expected service lives for private aircraft in the air transportation, depository and nondepository institutions, insurance carriers, and business service industries should be lengthened. Accordingly, the current geometric depreciation rate for aircraft in these industries of 0.0825 will be replaced by a new rate of 0.0660, beginning with 1960 investment. In addition, the

expected service lives for these aircraft will be extended to 25 years from the current 20 years, also beginning with 1960.

Light trucks. Estimates of CFC for light trucks used in the private sector will be prepared separately for the first time as part of this comprehensive revision. Currently, light trucks are included in the “truck, buses, and truck trailer” category. Beginning with 1992, light trucks will be assigned a geometric depreciation rate of 0.1925 and an expected service life of 17 years.

Autos. Estimates of CFC for autos used in the private sector will be based on a revised depreciation schedule, beginning with 1991 investment. On average, the estimates for autos will reflect a longer depreciation schedule based on longer service lives, and they will reflect purchasers’ values rather than producers’ values.

Extending the changes from the annual NIPA revisions

Between comprehensive revisions, BEA conducts annual NIPA revisions. Changes in methodology are sometimes adopted in annual NIPA revisions, but because annual revisions are limited to the most recent 3 years, these changes cannot be carried back to earlier years. In a comprehensive revision, BEA has the opportunity to incorporate more fully the changes that were adopted since the last comprehensive revision. The following sections describe extensions of methodology changes that were introduced in the annual revisions since the 1999 comprehensive revision.⁷⁴

NAICS. BEA has incorporated the following changes as the NIPAs and their source data moved toward fully reflecting NAICS. In the 2001 annual revision, estimates of change in private inventories and the source data for estimating PCE for most goods other than motor vehicles were converted to a NAICS basis back to 1997 (other NAICS-based source data were converted to an SIC basis).⁷⁵ In the 2002 annual revision, the source data for estimating PCE for services

74. See Eugene P. Seskin and Stephanie H. McCulla, “Annual Revision of the National Income and Product Accounts,” SURVEY 82 (August 2002): 29–31; Brent R. Moulton, Eugene P. Seskin, and David F. Sullivan, “Annual Revision of the National Income and Product Accounts,” SURVEY 81 (August 2001): 25–28; and Eugene P. Seskin and David F. Sullivan, “Annual Revision of the National Income and Product Accounts,” SURVEY 80 (August 2000): 27–29.

75. PCE is estimated on a commodity basis rather than on an industry basis. Data collected on an industry basis, such as those reported in the Census Bureau annual retail trade survey and service annual survey, are allocated to commodities using “merchandise-line” and “source of revenue” data from the 1997 Economic Census. The NAICS-based industry data improve the estimates of PCE by providing expanded coverage and greater detail than the SIC-based data.

73. In addition, this index is used to deflate custom software.

were converted to a NAICS basis back to 1998 (other NAICS-based source data were converted to an SIC basis). In the upcoming comprehensive revision, the NAICS-based source data for estimating PCE for services will be incorporated back to 1997 on a best-level basis.

PCE for net foreign travel. As part of the 2002 annual NIPA revision, BEA began to separately deflate the two components of “air fares foreign travel”—imports and the value of payments to U.S. carriers—in the PCE category of net foreign travel. The imports component was deflated using a BLS import price index (MPI) for air passenger fares, and the value of payments to U.S. carriers was deflated using a BLS IPI for international air passenger fares of U.S. carriers.⁷⁶ In this comprehensive revision, BEA will incorporate this methodology back to 1987. For periods prior to 1987, the combined category of “air fares foreign travel” will continue to be deflated using the MPI for air passenger fares.

Closing costs in rental income of persons. In this comprehensive revision, BEA will carry back to 1998 a methodological change that affects closing costs and that was incorporated in the 2002 annual revision. Closing costs, a deduction in deriving rental income of persons, consists of mortgage origination fees and “all other” closing costs.⁷⁷ Beginning with 1998, annual estimates of mortgage origination fees will be derived from data from the Federal Home Loan Mortgage Corporation (Freddie Mac), as reported under the Home Mortgage Disclosure Act, with an adjustment by BEA for underreporting. These data are available with a 1-year lag. Prior to 1998, estimates of mortgage origination fees will be derived from the discontinued Department of Housing and Urban Development survey on mortgage lending activity (SMLA).

Quarterly estimates will be interpolations and extrapolations as follows: Prior to 1998, using SMLA data as an indicator; for 1998–2001, using Freddie Mac data on mortgage originations as an indicator; and beginning with 2002, using an index of mortgage loan applications from the Mortgage Bankers Association as an indicator.

Interest paid by persons to business. In this comprehensive revision, BEA will carry back the method

used to estimate interest paid by persons to business, a component of both personal interest income and personal outlays, that was adopted on a best-change basis in the 2001 annual revision. Estimates of interest paid by persons are calculated as the product of consumer debt outstanding and of the effective rate of interest based on data from the FRB. Prior to the 2001 annual revision, the effective rate of interest was estimated judgmentally. The FRB’s effective rate of interest is a weighted average of interest rates charged by commercial banks and finance companies on eight types of consumer loans and is incorporated into its measure of households’ debt-service burden. BEA will adopt the new methodology on a best-level basis beginning with 1983, and it will judgmentally interpolate the estimates of interest paid by persons to business between 1980 and 1983.

Improvements to NIPA foreign transactions. Statistical differences that have arisen as a result of updated source data being incorporated into the ITAs, but not into the NIPAs, since the 1999 comprehensive NIPA revision will be eliminated. However, a new difference will arise because of a temporary difference in the definition of insurance services.⁷⁸ With this comprehensive revision, the NIPAs will reflect an estimate of “premium supplements” back to 1986. BEA plans to incorporate estimates of premium supplements into the ITAs in June 2004. However, with this comprehensive revision, the NIPAs and ITAs will reflect consistent historical estimates of insurance premiums and of “normal losses” and “net settlements” back to 1992.

New prices. The following are descriptions of extensions of new prices that were incorporated since the 1999 comprehensive revision.

An FRB price index for local area network (LAN) equipment that reflects quality improvements, which was adopted in the 2001 annual revision, will be incorporated back to 1992. The index is used to deflate communications equipment within private equipment and software.⁷⁹

PPIs and employment cost indexes, which replaced indexes based on AHEs as deflators for certain components of Federal Government defense and nondefense consumption expenditures and gross investment in the 2002 annual revision, will be incorporated back to 1993.

76. BEA seasonally adjusts the quarterly IPI and interpolates the quarterly estimates into months without using an indicator. Monthly IPIs are now available beginning with 2001, but the quarterly series is considered more reliable.

77. The change in the method for estimating closing costs will not affect “all other” closing costs.

78. For details on the new treatment of insurance services in the NIPAs, see Moulton and Seskin, 19–23. For details on the ITA treatment, see Bach, 35–37.

79. Beginning with 2001, the FRB’s LAN price will be replaced with a newly available BLS PPI.

Measuring the Services of Commercial Banks in the NIPAs

Changes in Concepts and Methods

By Dennis J. Fixler, Marshall B. Reinsdorf, and George M. Smith

AS part of the comprehensive revision of the national income and product accounts (NIPAs) scheduled for release on December 10, 2003, a definitional change will be introduced that recognizes the implicit services of commercial banks to borrowers. This change is briefly described in the June 2003 issue of the *SURVEY OF CURRENT BUSINESS*, and some associated table changes are described in the August 2003 issue.¹ This article provides a more detailed explanation of the new measure of banking output and its effect on the NIPAs.

The revised measures of banks' implicit financial services will improve the consistency of the NIPAs with the recommendations for the treatment of banks in the 1993 System of National Accounts (SNA), the principal international guidelines for national accounts.² The Bureau of Economic Analysis (BEA) continues to be a leader in incorporating major innovations of the SNA, such as chain-type indexes and the recognition of software as investment. For banking, the SNA recommends measuring implicit financial services to depositors using the difference between a risk-free "reference rate" and the average interest rate paid to depositors, and it recommends measuring implicit services to borrowers using the difference between the average interest rate paid by borrowers and the reference rate. To implement this approach, BEA will measure the reference rate by the average rate earned by banks on U.S. Treasury and U.S. agency securities. Measured in this way, the reference rate is consistently above the average rate of interest paid to depositors and consistently below the average rate of interest paid by borrowers.

Sullivan, "Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts: New and Redesigned Tables" *SURVEY OF CURRENT BUSINESS* 83, August 2003: 21.

2. Commission of the European Communities, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations, and World Bank, *System of National Accounts 1993* (Brussels/Luxembourg, New York, Paris, and Washington, DC, 1993).

Michael Murphy, Bonnie Retus, and Shaunda Villones contributed to the preparation of the estimates.

Background

How to value bank output has been a topic of much discussion in the national accounts literature because banks do not explicitly charge for all the financial services that they provide, relying instead on net receipts of interest for much of their revenue. In national income accounting, interest payments are generally treated as a distribution of income by businesses to investors who have provided them with funds, not as a payment for services. In particular, the domestic portion of the "net interest" component of national income is defined as interest paid by private business less interest received by private business. Applied to banks, the usual treatment of interest flows would yield a negative contribution to national income. Moreover, much of the value of the services that banks provide to their customers would be missed by the NIPAs. To avoid these results, an imputation for implicit financial services produced by banks is included in the NIPAs. Depositors purchase these implicit services with imputed interest income that eliminates the gap between the total interest received by banks and the total interest paid by banks.³

The view that all the implicit services of banks go to depositors is based on the notion that depositors are the ultimate lenders and that the net interest belongs to them. This view, however, does not adequately account for the implicit services of commercial banks to borrowers in their role as financial intermediaries. In that role, banks transform deposits into earning assets by providing many financial services. In particular, banks provide services related to the provision of credit that overcome problems of asymmetric information and that transfer risk to the bank. Banks devote staff time and other resources both to activities that serve depositors, such as clearing checks, and to activities that serve borrowers, such as making loan-underwriting decisions. Historically, banks were virtually the only source of credit to many households and businesses, and burgeoning needs for credit services were a major

3. Many European countries currently treat the implicit financial services of banks as an intermediate input to a fictitious sector, thereby keeping them out of GDP.

impetus for growth of this industry. Accordingly, a measure of bank output should reflect borrower services along with depositor services.

Interest margins as values of implicit services of banks

By treating banks' net interest income as imputed sales of services, the NIPAs recognize that adjustments to interest rates are substitutes for explicit fees to cover the cost of providing services to bank customers. If the reference rate represents the rate that banks earn on their investments after deducting expenses of providing services to borrowers, banks could, in principle, charge depositors explicitly for services and pay them the reference rate of interest. Similarly, banks could charge borrowers explicitly for services that they receive and reduce the rate of interest on loans to the reference rate. Indeed, over the last two decades banks have substituted fee income for net interest income: In 1980, net receipts of interest constituted 80 percent of commercial banks' gross income (which does not reflect taxes, noninterest expenses, loan-loss provisions, and gains or losses on sales of securities), but in 2000, they constituted 58 percent of banks' gross income.⁴ Therefore, the exclusion of implicitly priced services would result in a substantial overstatement of banks' output growth.

Rather than offsetting lower net interest margins by higher revenue from fees for services, banks with low net interest margins may simply provide fewer services. In these cases, interest rate differentials represent an implicit price for financial services. For example, in 2002, an Internet bank with limited services paid an average rate of 4 percent on deposits while small conventional banks paid an average rate of 3 percent.⁵ Depositors who chose the lower average deposit rate in order to obtain more services from a conventional bank thus paid an implicit price of 1 percent per year for those services.

Taking this logic one step further, depositors could dispense with the services of a bank entirely and keep their money in securities paying the reference rate of interest. Depositors who forego the opportunity to earn the reference rate in order to obtain the services of a bank choose to pay an implicit price for depositor services equal to the margin between the reference rate and the deposit rate.

The reference rate also represents an opportunity cost in the banks' investment decisions. If a highly liquid security with no credit risk is available to banks, the banks forego the opportunity to earn this security's rate of return—assumed to be the reference rate—when they invest in loans instead. The spread between this reference rate of return and the lending rate is the implicit price that the bank receives for providing financial services to borrowers, which include the cost of bearing risk. The spread must equal the marginal cost of providing borrower services if the bank is indifferent at the margin between investing in the reference-rate asset and investing in higher yielding loans. In a marketplace where competition keeps loans from being priced at levels that yield economic profits (profits in excess of a normal return on capital), we can expect an equilibrium where banks are indifferent between investment opportunities at the margin.

Borrowers from banks are willing to pay a margin over the reference rate because they require or want lender services that issuers of credit-market instruments bearing the reference rate of interest do not receive. For many, borrowing in capital markets is very costly or impossible because of the problems of asymmetric information noted earlier, and liquidating financial assets as an alternative to borrowing is also impossible. However, for marginal loan customers, liquidating assets that earn the reference rate or borrowing at approximately the reference rate in capital markets are alternative ways to obtain needed funds. In particular, both household and business borrowers often choose to hold financial assets when they could liquidate those assets and reduce their loan balances. For the marginal users of the borrowed funds, the difference between the loan rate and the reference rate represents the net marginal cost borne by borrowers for liquidity management, inducing the bank to accept their risk, and for any other services provided by the lender. This difference can therefore be viewed as an implicit price paid for credit services.

Finally, if the bank's net return on investments funded by deposits equals the reference rate, then the implicit price that the bank receives for providing services to depositors equals the spread between the reference rate and the rate paid on deposits. This spread equals the marginal cost of providing services to depositors if the bank is indifferent to marginal changes in amounts on deposit. In the short run, regulatory constraints on a bank's growth based on the amount of its equity capital could prevent it from accepting deposits until it reaches the point of indifference; however, in a longrun competitive equilibrium for the industry, deposit rates will just permit banks to cover

4. The percentages are calculated from data from the Federal Deposit Insurance Corporation at <www2.fdic.gov/hsob>. The growth of fee income partly reflects banks' entry into new kinds of activities, but the trend predates the repeal in 1999 of the Glass-Steagall Act's restrictions on bank activities.

5. This example is based on individual bank data at <www3.fdic.gov/idasp/main.asp>.

their costs. In addition, large banks that are perceived as very safe are able to borrow at approximately the reference rate in securities markets, thereby avoiding the costs of providing services to depositors. If these banks are indifferent at the margin between raising funds from depositors and raising funds in securities markets, the spread between the reference rate and the rate paid on deposits must approximately equal the marginal cost of providing services to depositors.

Theoretical framework

According to the “user cost of money” framework set out in Donovan (1978), Diewert (1974), and Barnett (1978) and applied to banking by Hancock (1985), Fixler (1993), and Fixler and Zieschang (1999), the reference rate plays an important role in models of economic decisionmaking by banks. The user cost of financial assets is an extension of a concept originally developed for nonfinancial assets. In a competitive marketplace where renting out a fixed capital asset yields economic profits of zero, the rental payment or user cost, uc_t , must equal the difference between the starting value of the asset, p_t , and the present value of the asset at reference rate of interest, r_r , at the end of the rental period, or $p_{t+1}/(1+r_r)$. If the growth rate of the asset's value from period t to period $t+1$ reflects depreciation, δ_t , and an expected rate of increase in asset prices of π_t , then substituting into the equation $uc_t = (p_t - p_{t+1})/(1+r_r)$ yields:

$$(1) \quad uc_t = p_t \left[1 - \frac{(1 + \pi_t - \delta_t)}{(1 + r_r)} \right] \\ = p_t (r_r - \pi_t + \delta_t) / (1 + r_r).$$

Alternatively, if uc_t is to be paid at the end of the period, then $uc_t = p_t(r_r - \pi_t + \delta_t)$. A parallel expression for a user cost formula for a financial asset with a rate of return of r_A would equal the difference between its immediate cash value in period t , assumed to be y_{At} , and the present value of selling the asset for an expected price of $y_{At+1} = (1 + \pi_t)y_{At}$ in period $t+1$ after receiving income of $r_A y_{At}$. Here, π_t represents both changes in asset prices and, if the asset is a debt instrument, expected changes in value due to creditworthiness developments. On the assumption that the opportunity is available to earn a rate of r_r on an asset that requires no costly services to the borrower, including the bearing of credit risk, r_r measures the banks' opportunity cost of financial capital.⁶ Hence r_r can be used as the discount rate to calculate the present value of the future cash flows. The user cost of holding an

6. Barnett (1978) describes the reference rate as a minimum rate of return that accounts for risk, but most applications of the reference rate, including the 1993 SNA, view it as a risk-free rate.

asset with a rate of return of r_A then becomes:⁷

$$(2) \quad y_{At} \left[1 - \frac{1 + r_A + \pi_t}{1 + r_r} \right] = y_{At} \left[\frac{r_r - r_A - \pi_t}{1 + r_r} \right].$$

A modified version of the user cost expression on the right-hand side of equation (2) can be used to measure the implicit services associated with financial assets of banks, such as loans. This version of the user cost formula omits π_t , which represents expected net holding gains. Changes in the market value of a debt instrument usually have no effect on the value of the liability recognized by the debtor, and the NIPAs must treat the creditor and the debtor symmetrically. More importantly, holding gains and losses are excluded from the concept of income measured by the national accounts, which is limited to the income that originates from current production of goods and services. Since credit losses can be treated as a kind of holding loss, the effect of omitting π_t is significant.⁸

The user cost formula in equation (2) assumes that interest is paid at the end of the period and that the asset and its user cost are valued at the beginning of the period. In practice, interest flows occur throughout the year, and measures of economic activity usually do not use beginning-of-year present values for sales that occur at different times over the course of the year. An alternative formula that values the user cost as of the end of the period is consistent with these practices. The end-of-period expression for the user cost of financial assets is $r_r - r_A$ (or, if the holding gains term is included, $r_r - r_A - \pi_t$). In implementing the revised treatment of banks, average interest rates will be calculated as ratios of interest accrued throughout the year to the average value of assets over the course of the year. In effect, these procedures adopt a mid-year perspective to value both interest payments and assets, using a simple sum of interest accruals to approximate a sum of interest accruals that are discounted to the middle of the year. The product of the interest rates and the asset values equals the total interest accrued over the course of the year.

Typically, banks' financial assets have negative user costs and their liabilities have positive user costs because the rate of the return on assets usually exceeds

7. Barnett (1978) uses a different approach to derive equation (2). He considers a consumer who maximizes life cycle utility subject to a set of budget constraints that the change in wealth in any period equals current income received minus current expenditures and who is able to invest in an instrument that earns the reference rate of return.

8. Since 1974, commercial banks' provision for credit losses has usually ranged from about 10 percent to about 20 percent of their net interest income. These ratios are calculated using data from the Federal Deposit Insurance Corporation, available at <www2.fdic.gov/hsob>. Realized net credit losses have been slightly lower than provisions for credit losses, partly because of timing differences and survivorship bias.

the reference rate, which in turn exceeds the rate paid on liabilities. To make the signs more intuitive for our purposes, the *user-cost price* of an asset is defined as the negative of the user cost, and the user-cost price of a liability is defined as its user cost. As a result, whenever a financial product contributes positively to economic profits, its price is positive. Because holding gains or losses are not part of the national accounts concept of current production, the term in the user cost expression for expected holding gains or losses is omitted from the user-cost price. The arbitrary asset i then has a user-cost price of:

$$(3) p_{A_i} = r_{A_i} - r_r$$

For liability products, the user-cost price is

$$(4) p_{L_i} = r_r - r_{L_i}$$

These user-cost price formulas do not include a term for service charges and other fees to borrowers or to depositors. For modeling economic decisionmaking by banks, fees to borrowers and to depositors should be included in user-cost prices, but for measuring banks' implicit sales of services, they should be treated as explicit sales.

Effect on the measure of imputed output

User cost of "own funds." The gross output of banks consists of explicit sales of services, which are booked as fee income, and implicit sales of services, which are currently measured by banks' net interest income, or $\sum_i r_{A_i} y_{A_i} - \sum_i r_{L_i} y_{L_i}$. Although the most important effect of the revised treatment of the implicitly priced services is the division of their value between borrowers and depositors, the revised treatment also reduces the total measure of implicit services. This reduction occurs because the difference between the total value of loans and other interest-earning assets and the total value of deposits and other interest-bearing liabilities is generally positive. The SNA terms this difference "own funds" because banks use their own funds to acquire the assets whose acquisition is not funded by the issuance of liabilities. Own funds represent stockholders' equity that is held in financial assets, or money furnished directly or indirectly (via retained earnings) by the banks' stockholders.⁹

To show how the lending of banks' own funds affects the revised measure of implicit financial services, express the total imputed output of banks, V , as the user-cost price of assets times the volume of assets plus

the user-cost price of liabilities times the volume of liabilities, or:

$$(5) V = \sum_i p_{A_i} y_{A_i} + \sum_i p_{L_i} y_{L_i} \\ = \sum_i (r_{A_i} - r_r) y_{A_i} + \sum_i (r_r - r_{L_i}) y_{L_i}.$$

In the last line of equation (5), the first term represents the value of implicitly priced services that the bank provides to borrowers, and the second term in equation (5) shows the value of the implicitly priced services that it provides to depositors and other lenders to the bank. A rearrangement of the terms in equation (5) reveals that V equals the current NIPA measure of imputed output minus the user cost of the own funds used to acquire assets:

$$(6) V = [\sum_i r_{A_i} y_{A_i} - \sum_i r_{L_i} y_{L_i}] - r_r [\sum_i y_{A_i} - \sum_i y_{L_i}].$$

The difference between the current measure of banks' imputed output and the revised measure equals the user cost of the assets acquired with banks' own funds. When a bank lends its own funds instead of funds from depositors, it does not need to use a portion of interest that it receives to cover the cost of providing services to depositors. Hence, less of the interest received from the borrower represents implicit fees for services and more of it represents net interest income earned by the bank. The measure of imputed output is reduced by an amount that is broadly consistent with an SNA recommendation that the return to lending of own funds be excluded from imputed output.¹⁰

Defining assets and liabilities. The measure of own funds in equation (6) is sensitive to which types of assets and liabilities are included. Arguments are sometimes made that only loans and deposits should be counted because banks have no control over other interest rates. However, BEA's measures of imputed bank output reflect all bank assets and liabilities that earn interest or imputed interest. (Imputed interest is earned by deposits.) As a result, substitution by banks between different types of assets, or between different types of liabilities, does not directly affect the measure of imputed output. For example, loans rose from about one-third of financial assets in 1951 to about two-thirds of financial assets in 2001, while deposits fell from almost 100 percent of liabilities to about 70 percent of liabilities.

Inclusion of all interest-bearing assets and liabilities also results in a better estimate of own funds used for lending. In particular, banks generally have more deposits than loans, so if only these items were counted, the estimate of own funds would generally be negative. Negative own funds result in estimates of imputed

9. However, the measure of banks' lending of own funds differs from the accounting entry for stockholders' equity on banks' balance sheets because own funds do not reflect all the assets and liabilities reflected in stockholders' equity.

10. SNA 1993, paragraph 6.125.

output that exceed the net interest received by banks. Since the justification for imputed output rests on net interest being a substitute for fee income, imputed output that is not “paid for” by net interest is hard to justify.

A narrow definition of assets that excludes amounts loaned to other banks or deposited at other banks can also lead to inconsistencies. The estimate of the gross output delivered to the customers of the banking industry should equal the value that could be calculated from a consolidated balance sheet for the industry, which would net out assets and liabilities that represent claims of one bank on another bank. For example, federal funds and repurchase agreements (which are combined in the data sources used for the estimates) are reported both as assets and as liabilities by banks. Like deposits, their interest rates are usually lower than the reference rate. The estimate of the implicit services associated with federal funds and repurchase agreements equals the user cost of the net liability position of the banking industry, but it is calculated by including a negative number for implicit services of federal funds and repurchase agreement gross assets (which consist primarily of interbank transactions) that partly offsets the positive number for implicit services of federal funds and repurchase agreement gross liabilities.

Table 1 shows the assets and liabilities included in an illustrative calculation of banks’ imputed output for 2001. In column 1 of the table are average values for the year of major balance sheet items, including those that have no role in the calculations of domestic imputed output. One asset, “cash items in process of collection” is displayed as a negative liability below deposits in order to show that it is netted out from deposits when calculating implicit depositor services. Items in process of collection are deducted from deposits because, in an accrual-accounting framework, these funds belong to the payee, not the check writer.

Column 2 in table 1 displays either the interest income or the interest expense for the year, depending on whether the item is an asset or a liability. Column 3 shows the book-value interest rate implied by dividing the interest income or expense by the average balance sheet value. Column 4 shows the user-cost prices, calculated as the margin between the item’s interest rate and the reference rate shown on line 8. Column 5 shows expansion factors needed to account for domestic output of foreign banks, which are calculated using ratios of balance sheet items for the total domestic banking industry to corresponding items for domestic offices of banks chartered in the United States. Column 6 shows the contribution to imputed output from each included item, calculated as the product of the average

balance sheet value, the user-cost price, and the expansion factor for foreign-owned offices.

The negative values for imputed output for assets associated with interbank transactions on lines 12 to 15 of table 1 prevent the implicit services that banks provide to each other from being included in the output delivered to other kinds of customers. These negative entries are offset elsewhere in table 1 by amounts included in imputed output on liabilities or in implicit services from Federal Reserve Banks. For example, the net output associated with Federal funds and repurchase agreements is the difference between the positive entry in the liability section of the table and the smaller negative entry for the asset.

The implicit borrower services on loans and leases in lines 4–5 of table 1 represent 41.9 percent of total imputed output. Implicit services to depositors, calculated as the sum of the entries on lines 24–30 and the adjustments on lines 13 and 14, represent 54.3 percent of imputed output or \$101.3 billion. Further, the user cost of own funds and foreign office deposits used for domestic lending on line 47 is \$45.7 billion. This \$45.7 billion can be decomposed into \$19.9 billion from the user cost of own funds of U.S. banks, \$23.7 for the user cost of foreign office deposits used for domestic lending, and \$2.1 billion for the user cost of funds from foreign sources that foreign banks lend domestically. Finally, a comparison of estimates of imputed output with and without the adjustment for domestic offices of foreign banks also shows that imputed output of \$11.2 billion out of a total of \$186.6 billion originates in the foreign-owned banking offices.

The assets of commercial banks also include balances due from Federal Reserve Banks, which include required reserves. In exchange for the user cost of these balances due (which equals the amount they would have earned if they had been invested at the reference rate of interest) banks are assumed to receive implicit services from the Federal Reserve Banks of equivalent value. To be consistent, implicit services from the Federal Reserve Banks are also imputed to the Federal Government on Treasury deposits, to the rest of the world on international deposits, and to business in connection with other deposits. Therefore, the total output of the Federal Reserve Banks equals the user cost of their deposit liabilities; no output is imputed in connection with their assets because they consist primarily of securities that earn the reference rate of interest. In the revised measures, the implicit services of Federal Reserve Banks that are consumed by commercial banks are treated as an intermediate input. Currently in the NIPAs, the output of the Federal Reserve Banks is estimated by their expenses, and a

portion of this output is included in implicit services to customers of the banking industry.

Foreign output of U.S. banks and domestic output of foreign banks. The primary data source for the estimates, the Federal Financial Institutions Examination Council's *Call Reports*, cover domestic and foreign offices of banks chartered in the United States.¹¹ Two adjustments to the basic estimates from the *Call Reports* are therefore necessary to estimate the domestic output

of all banks. First, an estimate of the output produced in the foreign offices of U.S. banks must be deducted from U.S. banks' total output. Second, the output of U.S. offices of foreign banks must be added.

The output of foreign offices of U.S. banks is currently measured as the excess of their interest receipts from borrowers over their interest payments to depositors. In recent years, the interest rate on loans in foreign offices has been roughly twice the rate on deposits, and the amount of deposits has been roughly twice the amount of loans. Consequently, interest received has approximately equaled interest paid in the foreign offices, so virtually no imputed output has

11. Beginning with 1985, the *Call Report* data are adjusted by the Board of Governors of the Federal Reserve System to take account of mergers; see Carlson and Perli (2003). *Call Report* data for 1984 and earlier are taken from the Federal Deposit Insurance Corporation, *Historical Statistics on Banking*, at <www2.fdic.gov/hsoab>.

1. Ratios are for (by line): Loans and leases (4 and 5); Securities other than U.S. government securities in bank credit (9); Cash assets (13, 14, 30); Interbank loans (15); Other assets (16); Transaction deposits (24); Nontransaction deposits other than large time deposits (26, 27, 29); Large time deposits (28); Borrowings from banks in the U.S. (33); Borrowings other than from banks in the U.S. (34).

2. Sum of lines 4-5, 8-9, and 12-16. Imputed interest from Federal Reserve Banks on line 37 is also

included in imputed gross output.

3. Imputed gross output shown excludes the effect of the adjustment for foreign banks using the factors in column (5).

4. Sum of lines 24, 26-30, 33, and 34. MMDAs Money market deposit accounts

been attributed to them.

In the revised measures of bank output, a significant amount of output will be attributed to foreign offices of U.S. banks. The revised measure of foreign office output equals the user cost of foreign office loans plus the user cost of foreign office deposits. Therefore, the increase in foreign office output equals the reference rate times the excess of foreign office deposits over foreign office loans. The excess deposits represent a source of funds for domestic lending that, like own funds, involve no domestically produced implicit services to depositors.

The output of U.S. offices of foreign banks is also affected by the change in the definition of imputed output. The domestic output of foreign banks is currently measured by scaling up the estimates of the output of U.S. banks using ratios of balance sheet items for all banking offices located in the U.S. to corresponding items for the offices of U.S. banks alone. The implicit assumption—which is made necessary by unavailability of data—is that the U.S. offices of foreign banks pay and receive the same interest rates as other banks in the United States. Rather than scaling up gross interest flows, the new procedure will scale up user costs of assets and liabilities. This will change the estimates of the domestic output of the foreign banks because the assets that are attributed to foreign banks do not exactly equal the liabilities. However, a more important source of revision to these estimates will be revisions to the estimates of the balance sheet ratios to incorporate new source data.

Measurement of interest rates

Estimation of user cost measures of imputed output requires a number of decisions about the specification of key concepts. One of these decisions concerns interest rates. From a theoretical standpoint, the use of either market interest rates or book-value interest rates can be defended. The book-value rates are computed by dividing the interest receipt or payment for a financial product by the book-value of that financial product on the balance sheet.

Market interest rates should be used in conjunction with the market values of assets (whose use is sometimes called the “creditor approach”), and book interest rates should be used in conjunction with the book-value of assets (the “debtor approach”). For most interest-bearing assets, banks report book values rather than market values. Perhaps for this reason, tests using market rates resulted in excessively volatile estimates of implicit services to depositors and to borrowers, including some negative values. In contrast, with book-

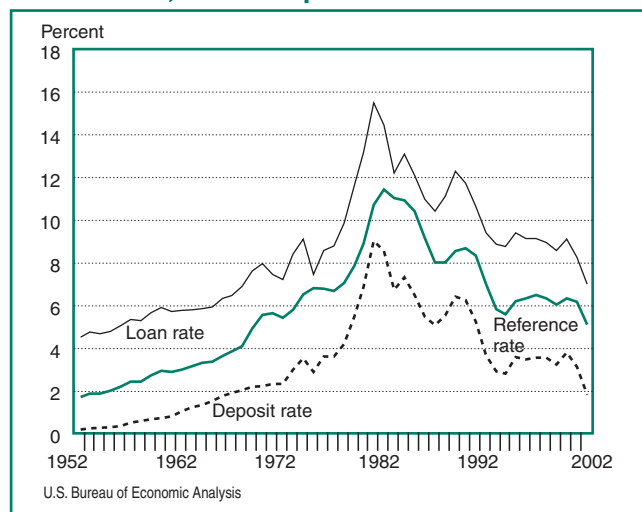

value rates, the user-cost prices of both loans and deposits are consistently positive and behave plausibly. The variation over time in relative positions of the book-value reference rate, loan rate, and deposit rate is shown in chart 1.

To compute the book-value reference rate, the interest received from Treasury and Federal agency securities is divided by the average book value of these securities over the period during which the interest was received. This method of calculating the reference rate results in estimates of zero for implicit borrower services consumed by the Federal Government. Although imputing no borrower services to Federal Government debt may seem inconsistent with imputing services to other types of bond issuers, Federal debt imposes virtually no liquidity or credit-risk costs on the bank. Letting implicit services for Federal debt equal zero makes GDP invariant to the proportion of Federal debt held by the banking sector.

Book-value interest rates for other assets and liabilities are calculated similarly to the reference rate. However, interest income from securities issued by state and local governments must be adjusted to reflect its tax-exempt status. The interest expense on liabilities used to fund purchases of these securities may be completely deductible, 80-percent deductible, or nondeductible, depending on the nature of the issuer and the data of purchase of the security. If the interest expense is completely deductible, then:

$$\text{taxable-equivalent rate} = \frac{\text{book-value rate}}{1 - \text{bank's marginal income tax rate}}$$

Chart 1. Relative Positions of the Reference Rate, the Loan Rate, and the Deposit Rate

Beginning with 1985, adjustments for taxable equivalency are from the Federal Reserve Board. For earlier years, adjustments are calculated using the above formula, with banks' average tax rate serving as a proxy for their marginal rate and an assumption that the user-cost price of state and local securities is nonnegative.

Effect on GDP and on gross domestic income

As discussed above, the revised measure of banks' imputed output will be lower than the current measure. The amount of the reduction caused by the change in the definition of the imputed output equals the sum of (1) the user cost of own funds; (2) the user cost of foreign office deposits available for domestic lending; and (3) part of the change in the estimate of imputed output of domestic offices of foreign banks.

GDP will fall more than the imputed output of banks will fall, because intermediate consumption will absorb some output that is currently counted in final demand. Implicit services count as intermediate consumption when consumed by businesses, household owner-occupiers, or nonprofit institutions serving households, and these sectors are the primary borrowers from banks. Consequently, when imputed output

that is currently allocated to depositors is instead allocated to borrowers, some imputed output will shift from final demand to intermediate consumption.

While the recognition of borrowers' implicit services reduces the importance of banks' imputed output to GDP, it also opens up a new channel of influence on the rate of change of current-dollar GDP. In chart 1, the reference rate is sometimes closer to the asset rate, implying that borrowers received a smaller share of implicit financial services, but at other times, it is closer to the liability rate. Although trends in the split of implicit services between borrowers and depositors are meaningful, short-run fluctuations of this split may not reflect equilibrium behavior. Because the reference rate demonstrates more inertia than the other rates, abrupt declines in interest rates tend to result in a temporary reclassification of imputed output from intermediate consumption (by borrowers) to final demand (by depositors), first raising and then lowering the growth rate of GDP. Abrupt increases in interest rates have the opposite effect. The Treasury and Federal agency securities that furnish the reference rate tend to have rates that are fixed for longer periods than the rates paid on liabilities and the rates earned on loans. Nevertheless, this troublesome effect is expected to be

Effect on GDP by Industry and on Gross State Product

The changes in the methods for measuring banks' imputed output and for allocating it to bank customers will affect the estimates of GDP by industry. GDP by industry measures the contribution of each private industry and of government to the Nation's GDP. It equals an industry's value added. For any private industry, GDP by industry is defined as gross output (which consists of sales or receipts and other operating income, commodity taxes, and inventory change) less purchases of intermediate inputs (which consist of energy, raw materials, semi-finished goods, and services, including services of banks).

Identifying inputs and outputs is less straightforward for banking than it is for most industries.¹ In the NIPA treatment, banks use primary and intermediate inputs to produce the financial services that constitute their output. Financial products such as deposits and loans are packages of financial services; thus deposits, though an inflow to banks, are not an input. The implicitly priced services associated with financial products are the banks' output, along with the services that carry explicit fees.

The changes in the treatment of the banking industry will not affect banks' purchases of intermediate inputs, so the change in this industry's value added will equal the change in its gross output. For other private industries, intermediate inputs will rise, reducing value added. Private industries consume relatively more borrower services than households and government, so their consumption of implicit services of banks will be higher when services currently shown as going to depositors are allocated to borrowers. Under the new treatment of government (described in Moulton and Seskin (2003, 30–31), GDP by industry for general government will not change, but government consumption expenditures and government gross output will fall by an amount equal to the reduction in governments' final purchases of banks' imputed output. For the economy as a whole, the increase in intermediate consumption of private industries will generally have a larger effect on GDP than the reduction in banks' total imputed output.

These revisions to GDP by industry will be reflected in revised estimates of gross state product (GSP). GSP measures the value added in production by the labor and property located in a state, and is controlled to national estimates of GDP by industry. GSP for a state is derived as the sum of the GSP originating in all industries in the state.

1. There is a considerable literature on the identification of inputs and outputs in banking, and the choice of a classification framework depends on the measurement question to be addressed. For examples of different frameworks, see Allen Berger and David Humphrey (1992).

small, and it will have almost no effect on real growth rates.

The revision in the measure of imputed output will change gross domestic income (GDI) by the same amount as it changes GDP. Imputed expenditures on financial services by households, by government, and by the rest of the world, which raise GDP, are matched by imputed interest flows, which raise GDI. Imputed expenditures by business have no effect on GDP because they are intermediate inputs, and imputed net interest payments by businesses to banks do not affect GDI because banks are also in the business sector.

Even though the balance between GDI and GDP will be unaffected by the revision, some elements of the calculation of the interest component of GDI will change. To be consistent with the guidelines of the SNA, the implicit services provided by banks to borrowers will be shown as a negative amount of imputed interest paid by borrowers.¹² The sum of monetary interest and imputed interest paid by borrowers, which is the total amount of interest paid by borrowers, will therefore decline. In effect, a portion of the interest paid by borrowers will be reclassified as a payment for implicit services; borrowers' imputed expenditures on services will rise by the same amount that their payments of interest fall. Note that negative imputed interest paid by nonbusiness borrowers to banks increases the "net interest" component of GDI in the same way as positive imputed interest paid by banks to nonbusiness customers.

Effects on quantity and price indexes

To estimate changes in the real value of imputed output, BEA will continue to use the method that it adopted in 1999. Thus, the rates of change of real total output and of real explicitly priced output will not be revised because of the change in the treatment of banking. However, the level of real total output and real imputed output will be revised for all years to reflect the revised level of current-dollar imputed output in the base year. In addition, the revisions to the weight of explicitly priced output will cause revisions to the rate of change of real imputed output because real imputed output is estimated as a residual.

Beginning with 1968, annual changes in the real value of banks' imputed output are estimated by assuming that banks' total output grows at the same rate as the output of the banking industry in the Bureau of Labor Statistics (BLS) estimates of productivity by industry. The BLS estimate of banks' total output is based on a weighted average of various indexes of bank activity, including bank transactions (for example,

checks cleared, ATM transactions, and electronic funds transfers), the number of outstanding loans of various types, and the number of trust accounts.¹³ To estimate chain-dollar real imputed output, BEA calculates a Fisher aggregate of a Laspeyres constant-dollar measure and a Paasche constant-dollar measure. Each constant-dollar measure of banks' imputed output equals (a) the constant-dollar value of banks' total output, estimated by extrapolating the base-year current-dollar estimate of banks' total output by the BLS estimate of the growth in banks' total output less (b) the constant-dollar real value of banks' explicitly priced output, estimated by deflating banks' service charges on deposit accounts and other noninterest income with the CPI for checking account and other bank services and then adding an estimate of banks' real fiduciary activities based on the growth of the number of trust department discretionary accounts.

Prior to 1968, annual changes in the real value of imputed output will continue to reflect the rate of growth in the hours worked by banks' employees with no adjustment for changes in these employees' productivity. Annual changes in the real value of explicitly charged output will continue to reflect the post-1968 methodology, and annual changes in the real value of total output will continue to equal the sum of changes in real imputed output and real explicitly priced output.

Results for 2001

Table 2 shows the breakdown by sector and by legal form of organization of the consumption of commercial banks' imputed output. As a result of the revision, the imputed output of commercial banks included in GDP falls by \$91.9 billion. A rise in intermediate consumption from about a fourth to about half of the total consumption of implicit services accounts for \$22.8 billion of the fall in GDP. Borrower services to household owner-occupants and nonprofit institutions account for much of this rise, but borrower services to corporations and to sole proprietorships and partnerships also contribute.

The remaining \$69.1 billion of the fall in GDP reflects a fall in imputed domestic output. One source of the fall in imputed domestic output is a \$13.0 billion fall in imputed output of U.S. offices of foreign banks attributable to revisions in estimates these offices' assets and liabilities.¹⁴ The other source is a \$56.0 billion change in imputed domestic output attributable to the

12. *SNA 1993*, Annex III, paragraphs 5-7.

13. The BLS methodology is explained in Kent Kunze, Mary Jablonski, and Mark Sieling (1998). BLS does not have a separate measure of the imputed output of banks.

14. Note that this revision would have occurred even without the change in the treatment of banks.

Table 2. Consumption of Imputed Output of Commercial Banks by Sector and Legal Form of Organization, 2001

1. In the comprehensive revision, the value of the services produced by general government, which represents governments' contribution to final demand, will be estimated by the cost of inputs, including purchases of implicit output of banks. The revised treatment of banking will indirectly reduce the services produced by general government because purchases of implicit output of banks will be reduced. Final demand of general government, which will equal the services produced by governments less their sales of services in the market, will also reflect the downward revision to governments' purchases of implicit output of banks.

adoption of the reference rate approach, which consists of (1) a \$13.4 billion fall in imputed output of U.S. offices of foreign banks; (2) an \$18.9 billion fall in the total imputed output of U.S. banks; and (3) a \$23.7 billion rise in the portion of the imputed output of U.S. banks allocated to their offshore offices.

Table 3 shows how the downward revision to GDP and GDI for 2001 affects the new seven-account summary of the NIPAs.¹⁵ The product side of account 1 shows that the \$91.9 fall in GDP consists of a reduction of \$78.1 billion in implicit services to persons, a reduction of \$8.9 billion in net exports of implicit services, and a reduction of \$4.9 billion in implicit services to governments. On the income side, the net operating surplus of private enterprises falls by \$91.9 billion.¹⁶

Account 2 shows the effect on the sources and uses of private enterprise income, which includes income of private businesses, imputed income from owner-occupied housing, and net interest paid by nonprofit institutions serving households. Imputed interest paid by banks to depositors falls by \$147.5 billion, and private enterprises borrowers pay -\$64.8 billion in imputed interest to banks. (As is explained above, implicit banking services to borrowers are shown as negative

15. In the comprehensive revision of the NIPAs, the traditional five summary accounts will be expanded to seven accounts; see Mayerhauser, Smith and Sullivan (2003, 8–15).

16. Net operating surplus is a measure of business income that equals gross value added less the costs of compensation of employees, taxes on production and imports—that is, indirect taxes such as sales and property taxes—less subsidies and consumption of fixed capital; financing costs, such as net interest, and business transfers are not subtracted.

imputed interest paid by borrowers.) Private enterprises will also receive \$120.4 billion less in imputed interest, consisting of a reduction of \$42.0 billion in imputed interest received by private enterprises on deposits and a new entry of -\$78.4 billion representing imputed interest received by banks from borrowers. Hence, net interest paid by private enterprises falls by \$91.9 billion, and GDI also falls by this amount.

Account 3, the personal income and outlay account, shows that the \$78.1 billion reduction in personal consumption expenditures consists of a \$90.1 billion reduction in implicit services to depositors that is partly offset by the new entry for implicit services to borrowers of \$12.0 billion. Account 5, the foreign transactions current account, shows that the \$8.9 billion decrease in net exports of implicit services shown in account 1 consists of a decrease of \$10.3 billion in imputed interest received by foreign depositors that is partly offset by imputed interest of -\$1.4 billion received from foreign borrowers. (Imputed interest on foreign borrowing excludes loans booked in foreign offices of U.S. banks because production in these foreign locations does not belong in U.S. domestic product.) Accounts 6 and 7 show that measures of saving, investment, and net lending to the rest of the world are unaffected by the revised treatment of implicit services of banks.

Future Research

The new measures of implicit services to bank borrowers are an important advance for the NIPAs. Nevertheless, many questions remain for future research. One question is how to treat off-balance sheet commitments, such as derivatives. A second is whether improvements are possible in the measures of real bank output. A third concerns the treatment of expected holding gains and losses and of credit losses.¹⁷ An allowance for credit losses is deducted from the value of loans and leases in calculating imputed output in order to place the timing of the recognition of these losses on an accrual basis. However, credit losses are not directly reflected in the measures of interest income that are used to calculate imputed output. If banks use a portion of interest income to offset credit losses, that portion is not available to pay for financial services. Furthermore, estimates of expected losses will be excluded from the measure of imputed output elsewhere in the revised NIPAs; see the discussion of insurance in Moulton and Seskin (2003, 19–21).

17. See Fixler and Moulton (2001).

Table 3. Revisions to Summary National Income and Product Accounts, 2001

[Billions of dollars]

Account 1. Domestic Income and Product Account, Proposed Less Published Estimates

Net operating surplus	-91.9	Personal consumption expenditures	-78.1
Private enterprises	-91.9	Implicit services furnished by banks	-78.1
Imputed interest paid	-212.3	Net exports of goods and services	-8.9
By banks to depositors	-147.5	Exports	-8.9
By borrowers to banks ¹	-64.8	Implicit services furnished by banks	-8.9
Less: Imputed interest received	-120.4	Government consumption expenditures and gross investment	-4.9
By depositors from banks ¹	-42.0	Federal	-0.4
By banks from borrowers	-78.4	Implicit services furnished by banks	-0.4
Gross domestic income	-91.9	State and local	-4.4

Foreign Direct Investment in the United States

Detail for Historical-Cost Position and Related Capital and Income Flows, 2002

The following tables present detailed estimates of the foreign direct investment position in the United States on a historical-cost, or book-value, basis and estimates of the related capital and income flows; summary estimates of services transactions are also presented. (For definitions, see the box “Key Terms.”) These estimates show the geographic and the industrial composition of foreign companies’ investment in the United States and the related capital, income, and services flows and can be used to determine how the composition of these items has changed over time. They expand on the estimates presented in articles in the July 2003 SURVEY OF CURRENT BUSINESS that summarized developments in the direct investment position at historical cost in 2002 and the annual revisions of the international accounts.¹

1. See Maria Borgia, “Direct Investment Positions for 2002: Country and Industry Detail,” SURVEY 83 (July 2003): 22–31; and Christopher L. Bach, “Annual Revision of the U.S. International Accounts, 1992–2002,” SURVEY 83 (July 2003): 32–45

This report was prepared by Jeffrey H. Lowe.

Data Availability

Estimates of the foreign direct investment position in the United States and of transactions between foreign parents and their U.S. affiliates that enter the U.S. international transactions (balance of payments) accounts are available on BEA’s Web site. To access the estimates, go to www.bea.gov, see “International,” click on “Direct Investment,” and then under “Foreign direct investment in the United States,” click on “Balance of payments and direct investment position data.”

Acknowledgments

The survey from which the data for the foreign direct investment position in the United States and the related capital and income flows were drawn was conducted under the supervision of Gregory G. Fouch, assisted by Peter J. Fox, Michelle L. Granson, Barbara C. Huang, Y. Louise Ku-Graf, Susan M. LaPorte, and Beverly E. Palmer. Computer programming for data estimation and tabulation was provided by Karen E. Poffel, assisted by Paula D. Brown and Tracy K. Leigh.

The estimates presented here incorporate two major changes in industry classification from those published in September 2002.² First, the detailed industry estimates of foreign direct investment position, capital flows, income, and services transactions are now classified by International Survey Industry (ISI) classifications derived from the 1997 North American Industry Classification System (NAICS).³ Previously, the by-industry estimates had been based on ISI classifications derived from the 1987 Standard Industrial Classification (SIC) system. Many of the NAICS-based industries correspond to SIC-based industries. However, many of these industries have been rearranged among the higher level groups in which they appear. In addition, the new classification introduces several new higher level groups. For example, the new category “finance (except depository institutions) and insurance” includes firms that were shown in the old SIC-based categories “finance (except depository institutions)” and “insurance.” Second, petroleum is no longer shown as a separate major industry in the tables; instead, the various petroleum-related activities are distributed among the major NAICS industry groups or sectors to which they belong. Estimates for petroleum as previously

2. For additional information on these changes, see the box “New Industry Classifications” in Borgia, 26.

3. Beginning with the 2002 benchmark survey of foreign direct investment in the United States, the ISI classifications will be derived from the 2002 NAICS.

General Notes to the Tables

- Detail may not add to totals, because of rounding.
- An asterisk “(*)” indicates a value between –\$500,000 and \$500,000 or between –0.5 percent and 0.5 percent.
- A “(D)” indicates that the data in the cell have been suppressed to avoid disclosure of the data of individual companies.
- The European Union (15) comprises Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Spain, Sweden, and the United Kingdom.
- OPEC is the Organization of Petroleum Exporting Countries. Its members are Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.

Key Terms

The key terms used in this statistical presentation are described in this box. For a more detailed discussion of these terms and the methodologies used to prepare the estimates, see *Foreign Direct Investment in the United States: Final Results from the 1997 Benchmark Survey* (Washington, DC: U.S. Government Printing Office, June 2001). The methodology is also available at BEA's Web site at www.bea.gov.

Direct investment. Investment in which a resident of one country obtains a lasting interest in, and a degree of influence over the management of, a business enterprise in another country. In the United States, the criterion used to distinguish direct investment from other types of investment is ownership of at least 10 percent of the voting securities of an incorporated business enterprise or the equivalent interest in an unincorporated business enterprise.

Foreign direct investment in the United States (FDIUS). The ownership or control, directly or indirectly, by one foreign resident of 10 percent or more of the voting securities of an incorporated U.S. business enterprise or the equivalent interest in an unincorporated U.S. business enterprise.

U.S. affiliate. A U.S. business enterprise in which a single foreign investor (that is, a **foreign parent**) owns at least 10 percent of the voting securities, or the equivalent.

Ultimate beneficial owner (UBO). That person (in the broad legal sense, including a company), proceeding up the affiliate's ownership chain beginning with the foreign parent, that is not owned more than 50 percent by another person. The UBO ultimately owns or controls the affiliate and derives the benefits associated with ownership or control. Unlike the foreign parent, the UBO of a U.S. affiliate may be located in the United States.

Foreign parent group. Consists of (1) the foreign parent, (2) any foreign person, proceeding up the foreign parent's ownership chain, that owns more than 50 percent of the person below it, up to and including the UBO, and (3) any foreign person, proceeding down the ownership chain(s) of each of these members, that is owned more than 50 percent by the person above it.

Direct investment capital flows. Funds that foreign parent companies provide to their U.S. affiliates net of funds that U.S. affiliates provide to their foreign parents. Capital flows include the funds that foreign direct investors pay to unaffiliated U.S. residents when affiliates are acquired and the funds that foreign investors receive from them when affiliates are sold. FDIUS capital flows also include debt and equity transactions between U.S. affiliates and members of their foreign parent groups, described as follows.

Direct investment capital flows consist of equity capital, inter-company debt, and reinvested earnings. **Equity capital flows** are the net of equity capital increases and decreases. Equity capital increases consist of payments by foreign parents to unaffiliated third parties in the United States for the purchase of capital stock or other equity interests when they acquire an existing business, payments made to acquire additional ownership interests in their U.S. affiliates, and capital contributions to their U.S. affiliates. Equity capital decreases are the funds foreign parents receive from U.S. persons when they reduce their equity interest in their U.S. affiliates. **Intercompany debt flows** result from changes in net outstanding loans and trade accounts between foreign parents (or other members of the foreign parent groups) and their U.S. affiliates, including loans by parents to affiliates and loans by affiliates to parents. **Reinvested earnings** are the foreign parents' claim on the current-period undistributed after-tax earnings of

the U.S. affiliates.

Foreign direct investment position in the United States. The value of foreign direct investors' equity in, and net outstanding loans to, their U.S. affiliates. The position may be viewed as the foreign direct investors' net financial claims on their U.S. affiliates, whether in the form of equity (including retained earnings) or debt.

BEA prepares estimates of the positions for FDIUS that are valued on three bases—historical cost, current cost, and market value. See tables 1 and 3 in this article, and the box "Alternative Measures of the Direct Investment Positions" in Maria Borgia, "Direct Investment Positions for 2002: Country and Industry Detail" in *SURVEY OF CURRENT BUSINESS* 83 (July 2003): 22.

Valuation adjustments to the historical-cost position. Adjustments that are made to account for the differences between changes in the historical-cost position, which are measured at book value, and direct investment capital flows, which are measured at transaction value. (Unlike the positions on a current-cost and market-value basis, the historical-cost position is not adjusted to account for changes in the replacement cost of the tangible assets of affiliates or in the market value of foreign parent companies' equity in U.S. affiliates.)

Valuation adjustments to the historical-cost position consist of currency translation and "other" valuation adjustments. **Currency-translation adjustments** are made to account for changes in the exchange rates that are used to translate U.S. affiliates' foreign-currency-denominated assets and liabilities into U.S. dollars. The precise effects of currency fluctuations on these adjustments depend on the value and currency composition of U.S. affiliates' assets and liabilities. If an affiliate's assets exceed its liabilities denominated in a particular foreign currency, depreciation (appreciation) of the currency against the dollar will result in negative (positive) translation adjustments. In the less common (but not unusual) case of a net liability position in a foreign currency, depreciation (appreciation) of the currency will result in positive (negative) adjustments.

"Other" valuation adjustments are made to account for differences between the proceeds from the sale or liquidation of U.S. affiliates and their book values, for differences between the purchase prices of affiliates and their book values, for writeoffs resulting from uncompensated expropriations of affiliates, and for capital gains and losses (other than translation adjustments). These capital gains and losses represent the revaluation of the assets of ongoing U.S. affiliates for reasons other than exchange-rate changes, such as the sale of assets (other than inventory) for an amount different from their book value. In addition, for individual countries and industries, adjustments may be made to effect changes in the industry of an affiliate or in the country of foreign parent.

Direct investment income is the return on the foreign direct investment position in the United States. It consists of earnings (that is, the foreign parents' shares in the net income of their U.S. affiliates) and the net interest paid by the U.S. affiliates on outstanding loans and trade accounts between the U.S. affiliates and their foreign parent groups.

Services transactions represent receipts and payments between U.S. affiliates and their foreign parents for services provided to one another. They consist of **royalties and license fees** for the use or sale of intangible property or rights (including patents, trademarks, and copyrights), and **other private services** (consisting of service charges, rentals for tangible property, and film and television tape rentals).

constituted are shown as an addendum to table 17, which shows selected direct investment items by detailed industry of U.S. affiliate. To facilitate assessment of the effects of these changes and to provide a bridge between the estimates classified on the old basis and the new basis, table A shows data for selected items for 1999 by industry of U.S. affiliate on an SIC basis.

The estimates in tables 4–18 differ in two respects from those of comparable items in the international investment position of the United States and in the U.S. international transactions accounts.⁴ First, these estimates are on a historical-cost basis, the only basis on which detailed estimates by country and by industry are available. In contrast, the aggregate estimates of the direct investment position that are included in the international investment position are presented on both a current-cost and a market-value basis, and the aggregate estimates of direct investment income (recorded in the current account) and capital flows (recorded in the financial account) in the U.S. international transactions accounts are presented on a current-cost basis. Second, the estimates of direct investment income and services in these tables, unlike those in the U.S. international transactions accounts, are net (after deduction) of U.S. and foreign withholding taxes. Estimates that are gross of withholding taxes are not available at the detailed country by industry level shown in tables 4–18.

Table 1 presents the total foreign direct investment position in the United States and a comparable rate of return on the position on all three valuation bases (historical cost, current cost, and market value). Table 2 presents a reconciliation of the estimates in tables 4–18 with those in the U.S. international transactions accounts. Table 3 presents a short time-series of the major accounts on both a historical-cost basis and as presented in the international transactions accounts and the international investment position accounts.

Revisions to the estimates

Table B compares the revised estimates by area of foreign parent for 2000–2002 with the previously published estimates.⁵ The direct investment position on a historical-cost basis was revised up \$42.6 billion for 2000 and \$34.1 billion for 2001. Capital inflows were revised up for all 3 years—\$13.1 billion for 2000, \$19.5 billion for 2001, and \$6.4 billion for 2002—mainly resulting from upward revisions to equity capital inflows. Income was revised down for all 3 years—\$4.5 billion for 2000, \$7.1 billion

4. See Elena L. Nguyen, "The International Investment Position of the United States at Yearend 2002," SURVEY 83 (July 2003): 12–21; and Douglas B. Weinberg and Patricia E. Abaroa, "U.S. International Transactions, First Quarter 2003," SURVEY 83 (July 2003): 49–113, which includes annual estimates for 1971–2002.

5. No data are shown for 2002 in the direct investment position columns because estimates for 2002 were first published in the July 2003 SURVEY and have not been revised. No data are shown for royalties and license fees and other private services for 2002 because estimates net of withholding taxes are presented in this report for the first time.

for 2001, and \$3.9 billion for 2002—mostly resulting from downward revisions to affiliates' earnings. Net payments for royalties and license fees were revised down \$0.2 billion for 2000 and were revised up \$0.2 billion for 2001. Net payments for other private services were

revised down less than \$0.1 billion for 2000 and revised down \$1.7 billion for 2001. The sizable revision in 2001 resulted from a large revision to U.S. affiliates' payments.

Tables 1–18 follow.

1. On a historical-cost basis, direct investment income excludes capital gains and losses and is computed without a current-cost adjustment to earnings; it equals the sum of lines 9 and 14 of table 2. The rate of return based on historical cost equals this measure of income divided by the average of the beginning- and end-of-year historical-cost direct investment positions. In accordance with international guidelines, this measure of income, like the other measures shown in this table, is recorded gross (before deduction) of U.S. and foreign withholding taxes on distributed earnings and interest. However, it differs from the measure disaggregated by country and industry in subsequent tables, which is recorded net (after deduction) of withholding taxes, because withholding tax data are not available by country or industry.

2. On a current-cost basis, direct investment income excludes capital gains and losses and includes a current-cost adjustment to earnings; the latter adjusts depreciation, depletion, and expensed petroleum exploration and development costs to reflect current-period prices, and to more closely align income earned in a given period with charges against

income in the same period, as required for the national and international economic accounts. Income on a current-cost basis equals line 1 of table 2. The rate of return based on current cost equals this measure of income divided by the average of the beginning- and end-of-year current-cost direct investment positions.

3. On a market-value basis, direct investment income measures financial return to investors; thus, it includes capital gains and losses of the affiliate but excludes the current-cost adjustment, which is an economic accounting adjustment, and currency translation adjustments. It is derived as line 1 minus line 8 of table 2, plus the part of the total in column 11 of table 6 that represents capital gains and losses other than currency translation adjustments. The rate of return based on market value equals this measure of income divided by the average of the beginning- and end-of-year direct investment positions at market value.

1. Withholding taxes on "other" private services transactions between U.S. affiliates and their foreign parent groups are assumed to be negligible, and no estimates of them are made. Therefore, there is no difference between the before-tax estimates shown in the international transactions accounts and the after-tax estimates shown in the following tables.

NOTE: This table reconciles the estimates for which country and industry detail are presented in this report with the aggregate estimates presented in the U.S. international transactions accounts in the July 2003 SURVEY OF CURRENT BUSINESS

(see "U.S. International Transactions, First Quarter 2003," SURVEY 83 (July 2003): 49–113). In the international transactions accounts, the earnings component of direct investment income and the reinvested earnings component of capital inflows are adjusted to a current-cost basis, and direct investment current-account items are adjusted to be gross (before deduction) of U.S. and foreign withholding taxes. These adjustments are not made to the estimates in tables 4–18 in this report, because the source data needed to make the adjustments by country and industry are not available.
IT International transactions

Table 3. Foreign Direct Investment in the United States: Position and Balance of Payments Flows, 1994–2002

1. An increase in U.S. affiliates' receivables is a decrease in net intercompany debt and a capital outflow.
 Note: In this table, unlike in the international transactions accounts, reinvested earnings are shown without a current-cost adjustment.

1. Reinvested earnings divided by earnings.

2. Reinvestment ratio is not defined because reinvested earnings are negative.

NOTE. In this table, distributed earnings are shown before deduction of withholding taxes. Unlike in the international transactions accounts, earnings and reinvested earnings are shown without a current-cost adjustment.

Table 8. Foreign Direct Investment in the United States: Income and Its Components

1. Consists of service charges, rentals for the use of tangible property, and film and television tape rentals. In 2002, U.S. affiliates' payments of service charges were \$14,147 million, payments of rentals for the use of tangible property were \$687 million, and payments of film and television tape rentals were \$4 million; U.S. affiliates' receipts were \$17,840 million,

\$462 million, and \$2 million, respectively.

NOTE: In this table, unlike in the international transactions accounts, royalties and license fees are shown net of withholding taxes.

Table 10.1. Foreign Direct Investment Position in the United States on a Historical-Cost Basis, 1999

[Millions of dollars]

1. The ultimate beneficial owner is that person, proceeding up a U.S. affiliate's ownership chain, beginning with and including the foreign parent, that is not owned more than 50 percent by another person. The country of ultimate beneficial owner is often the same as that of the foreign parent, but it may be a different foreign country or the United States.

NOTE: In this table, unlike in the international transactions accounts, income is shown net of withholding taxes and without a current-cost adjustment.

U.S. Direct Investment Abroad

Detail for Historical-Cost Position and Related Capital and Income Flows, 2002

The following tables present detailed estimates of the U.S. direct investment position abroad on a historical-cost, or book-value, basis and estimates of the related capital and income flows; summary estimates of services transactions are also presented. (For definitions, see the box “Key Terms.”) These estimates show the geographic and the industrial composition of U.S. companies’ investment abroad and the related capital, income, and services flows and can be used to determine how the composition of these items has changed over time. They expand on the estimates presented in articles in the July 2003 SURVEY OF CURRENT BUSINESS that summarized developments in the direct investment position at historical cost in 2002 and the annual revision of the international accounts.¹

The estimates for 1999–2002 of the U.S. direct investment position abroad at yearend and the estimates of capital flows, income, and services transactions incorpo-

rate the results of BEA’s 1999 benchmark survey of U.S. direct investment abroad (USDIA); the prior benchmark survey covered 1994. The revisions to the estimates for 2000 forward also reflect the incorporation of new or revised data from BEA’s quarterly surveys of transactions between U.S. parents and their foreign affiliates and of annual surveys of financial and operating data of U.S. parents and their foreign affiliates.

The estimates presented here incorporate two major changes in industry classification from those published in September 2002.² First, the detailed industry estimates of U.S. direct investment position abroad, capital flows, income, and services transactions are now classified by International Survey Industry (ISI) classifications derived from the 1997 North American Industry Classification System (NAICS).³ Previously, the by-industry estimates had been based on ISI classifications derived from the 1987 Standard Industrial Classification (SIC) system. Many of the NAICS-based ISI industries correspond to SIC-based industries. However, many of these industries have been rearranged among the higher level groups in

1. See Maria Barga, “Direct Investment Positions for 2002: Country and Industry Detail,” SURVEY 83 (July 2003): 22–31; and Christopher L. Bach, “Annual Revision of the U.S. International Accounts, 1992–2002,” SURVEY 83 (July 2003): 32–45.

2. For additional information on these changes, see the box “New Industry Classifications” in Barga, 26.

3. Beginning with the upcoming 2004 benchmark survey of U.S. direct investment abroad, the ISI classifications will be derived from the 2002 NAICS.

This report was prepared by Jeffrey H. Lowe.

Data Availability

Estimates of the U.S. direct investment position abroad and of transactions between U.S. parents and their foreign affiliates that enter the U.S. international transactions (balance of payments) accounts are available on BEA’s Web site. To access the estimates, go to www.bea.gov, see “International,” click on “Direct Investment,” and then under “U.S. direct investment abroad,” click on “Balance of payments and direct investment position data.”

Acknowledgments

The survey from which the data for the U.S. direct investment position abroad and the related capital and income flows were drawn was conducted under the supervision of Mark W. New, assisted by Laura A. Downey, Javier J. Hodge, Marie K. Laddomada, Sherry Lee, Leila C. Morrison, Chad M. Poist, John E. Terpening, and Dwayne Torney. Computer programming for data estimation and tabulation was provided by Marie Colosimo, assisted by Neeta Kapoor, and for benchmarking procedures, by Sherry Lee.

General Notes to the Tables

- Detail may not add to totals, because of rounding.
- An asterisk “(*)” indicates a value between –\$500,000 and \$500,000 or between –0.5 percent and 0.5 percent.
- A “(D)” indicates that the data in the cell have been suppressed to avoid the disclosure of data of individual companies.
- “Eastern Europe” comprises Albania, Armenia, Azerbaijan, Belarus, Bulgaria, Czech Republic, Estonia, Georgia, Hungary, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Poland, Romania, Russia, Slovakia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan.
- The European Union (15) comprises Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Spain, Sweden, and the United Kingdom.
- OPEC is the Organization of Petroleum Exporting Countries. Its members are Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.

Key Terms

The key terms used in this statistical presentation are described in this box. For a more detailed discussion of these terms and the methodology used to prepare the estimates, see *U.S. Direct Investment Abroad: 1994 Benchmark Survey, Final Results* (Washington, DC: U.S. Government Printing Office, May 1998). (The final results of the 1999 benchmark survey of U.S. direct investment abroad, including an updated methodology, is scheduled to be published in the coming months.) The methodology is also available at BEA's Web site at www.bea.gov.

Direct investment. Investment in which a resident of one country obtains a lasting interest in, and a degree of influence over the management of, a business enterprise in another country. In the United States, the criterion used to distinguish direct investment from other types of investment is ownership of at least 10 percent of the voting securities of an incorporated business enterprise or the equivalent interest in an unincorporated business enterprise.

U.S. direct investment abroad (USDIA). The ownership or control, directly or indirectly, by one U.S. resident of 10 percent or more of the voting securities of an incorporated foreign business enterprise or the equivalent interest in an unincorporated foreign business enterprise.

Foreign affiliate. A foreign business enterprise in which a single U.S. investor (that is, a U.S. parent) owns at least 10 percent of the voting securities, or the equivalent.

Direct investment capital flows. Funds that U.S. parent companies provide to their foreign affiliates net of funds that foreign affiliates provide to their U.S. parents. Capital flows also include the funds that U.S. direct investors pay to unaffiliated foreign parties when affiliates are acquired and the funds that U.S. direct investors receive from them when affiliates are sold.

Direct investment capital flows consist of equity capital, intercompany debt, and reinvested earnings. **Equity capital flows** are the net of equity capital increases and decreases. Equity capital increases consist of payments by U.S. parents to unaffiliated foreign parties for the purchase of capital stock or other equity interests when they acquire an existing foreign business, payments made to acquire additional ownership interests in their foreign affiliates, and capital contributions to their foreign affiliates. Equity capital decreases are the funds U.S. parents receive when they reduce their equity interest in their foreign affiliates. **Intercompany debt flows** result from changes in net outstanding loans and trade accounts between U.S. parents and their foreign affiliates, including loans by parents to affiliates and loans by affiliates to parents. **Reinvested earnings** are the U.S. parents' claim on the current-period undistributed after-tax earnings of their foreign affiliates.

U.S. direct investment position abroad. The value of U.S. direct investors' equity in, and net outstanding loans to, their foreign affiliates. The position may be viewed as the U.S. direct investors' net financial claims on their foreign affiliates, whether in the form of equity (including reinvested earnings) or debt.

BEA prepares estimates of the positions for USDIA that are valued on three bases—historical cost, current cost, and market

value. See tables 1 and 3 in this article, and also see the box, "Alternative Measures of the Direct Investment Positions" in Maria Borgia, "Direct Investment Positions for 2002: Country and Industry Detail" in *SURVEY OF CURRENT BUSINESS* 83 (July 2003): 22.

Valuation adjustments to the historical-cost position. Adjustments that are made to account for the differences between changes in the historical-cost position, which are measured at book value, and direct investment capital flows, which are measured at transaction value. (Unlike the positions on a current-cost and market-value basis, the historical-cost position is not adjusted to account for changes in the replacement cost of the tangible assets of affiliates or in the market value of U.S. parent companies' equity in foreign affiliates.)

Valuation adjustments to the historical-cost position consist of currency translation and "other" valuation adjustments. Currency-translation adjustments are made to account for changes in the exchange rates that are used to translate foreign affiliates' foreign-currency-denominated assets and liabilities into U.S. dollars. The precise effects of currency fluctuations on these adjustments depend on the value and currency composition of affiliates' assets and liabilities. If an affiliate's assets exceed its liabilities denominated in a particular foreign currency, depreciation of the currency against the dollar will result in negative translation adjustments, and appreciation of the currency will result in positive adjustments. In the less common (but not unusual) case of a net liability position in a foreign currency, depreciation of the currency will result in positive adjustments, and appreciation will result in negative adjustments.

"Other" valuation adjustments are made to account for differences between the proceeds from the sale or liquidation of foreign affiliates and their book values, for differences between the purchase prices of affiliates and their book values, for write-offs resulting from uncompensated expropriations of affiliates, and for capital gains and losses (other than translation adjustments). These capital gains and losses represent the revaluation of the assets of ongoing foreign affiliates for reasons other than exchange-rate changes, such as the sale of assets (other than inventory) for an amount different from their book value. Also, for individual countries and industries, adjustments may be made to effect changes in the industry or country of a foreign affiliate.

Direct investment income is the return on the U.S. direct investment position abroad. It consists of earnings (that is, the U.S. parents' shares in the net income of their foreign affiliates) and the net interest received by the U.S. parents on outstanding loans and trade accounts between the U.S. parents and their foreign affiliates.

Services transactions represent receipts and payments between U.S. parents and their foreign affiliates for services provided to one another. They consist of **royalties and license fees** for the use or sale of intangible property or rights (including patents, trademarks, and copyrights) and for **other private services** (consisting of service charges, rentals for tangible property, and film and television tape rentals).

which they appear. One major difference is that nonbank holding companies, previously grouped in the SIC-based category "finance (except depository institutions), insurance, and real estate," are now grouped in the NAICS-based category "management of nonbank companies and enterprises," which is included in the tables in "other industries." Table 19 provides information on holding companies, showing the countries in which they are most significant.

Second, petroleum is no longer shown as a separate major industry in the tables; instead, the various petroleum-related activities are distributed among the major NAICS industry groups or sectors to which they belong. Estimates for petroleum as previously constituted are shown as an addendum to table 17, which shows selected direct investment items by detailed industry of foreign affiliate. To facilitate assessment of the effects of these changes and to provide a bridge between the estimates classified on the old basis and on the new basis, table A shows data for selected items for 1999 by industry of foreign affiliate on an SIC basis.

In order to make BEA's international accounts more consistent with international guidelines, the estimates presented here also incorporate a change in geographical classification. In these estimates, affiliates that have operations spanning more than one country and that are engaged in petroleum shipping, other water transportation, or offshore oil and gas drilling are now classified in the country of residence of the operator of the ship or the equipment. In most cases, the country of the operator is the same as the country of incorporation. Previously, these affiliates were classified in a separate geographic category "international."⁴

The estimates in tables 4–19 differ in two respects from those of comparable items in the international investment position of the United States and in the U.S. international transactions accounts.⁵ First, these estimates are on a historical-cost basis, the only basis on which detailed estimates by country and by industry are available. In contrast, the aggregate estimates of the direct investment position that are included in the international investment position are presented on both a current-cost and a market-value basis, and the aggregate estimates of direct investment income (recorded in the current account) and capital flows (recorded in the financial account) in the U.S. international transactions accounts are presented on a current-cost basis. Second, the estimates of direct investment income and services in these tables, unlike those in the U.S. international transactions accounts, are net (after deduction) of U.S. and

Note: In this table, unlike in the international transactions accounts, income and capital outflows are shown without a current-cost adjustment, and income is shown net of withholding taxes.

4. See International Monetary Fund, *Balance of Payments Manual* (BPM5), 5th ed. (Washington, DC: 1993).

5. See Elena L. Nguyen, "The International Investment Position of the United States at Yearend 2002," *SURVEY* 83 (July 2003): 13–21; and Douglas B. Weinberg and Patricia E. Abaroa, "U.S. International Transactions, First Quarter 2003," *SURVEY* 83 (July 2003): 49–113, which includes annual estimates for 1971–2002.

foreign withholding taxes. Estimates that are gross of withholding taxes are not available at the detailed country by industry level shown in tables 4–19.

Table 1 presents the total U.S. direct investment position abroad and a comparable rate of return on the position on all three valuation bases (historical cost, current cost, and market value). Table 2 presents a reconciliation of the estimates in tables 4–19 with those in the U.S. international transactions accounts. Table 3 presents a short time-series of the major accounts on both a historical-cost basis and as presented in the international transactions accounts and the international investment position accounts.

Revisions to the estimates

Table B compares the revised estimates by area of foreign affiliate for 1999–2002 with the estimates that were linked to the 1994 benchmark survey.⁶ Comparisons by industry are not possible for 2000–2002, because the revised estimates can be classified by industry only on the basis of the new NAICS-based classifications, while the previous estimates can be classified by industry only on the basis of the old SIC-based classifications. Comparisons by industry are shown for 1999 because both the revised estimates and the previous estimates are available on an SIC basis.

Revisions for 1999. There were upward revisions for each of the accounts shown in table B. The direct investment position on a historical-cost basis was revised up \$42.8 billion, to \$1,216.0 billion. Capital outflows were revised up \$34.8 billion, to \$209.4 billion, and income was revised up \$2.0 billion, to \$114.3 billion. Net receipts of royalties and license fees were revised up \$2.2 billion, to \$24.0 billion; U.S. parents' receipts were revised up \$2.6 billion, to \$26.2 billion, and U.S. parents' payments were revised up \$0.5 billion, to \$2.2 billion. Net receipts for other private services were revised up \$1.7 billion, to \$6.7 billion; U.S. parents' receipts were revised up \$4.2 billion, to \$22.2 billion, and U.S. parents' payments were revised up \$2.5 billion, to \$15.5 billion. In general, the upward revisions were widespread by area and by industry, but there were downward revisions in a few areas and industries in each of the accounts.

Revisions for 2000–2002. The direct investment position was revised up \$22.8 billion for 2000 and \$1.6 billion for 2001. Capital outflows were revised down \$22.3 billion for 2000, down \$10.2 billion for 2001, and up \$10.8 billion for 2002. For capital outflows, the revision for 2000 largely resulted from a downward revision to net intercompany debt outflows, the revision for 2001 mainly resulted from a downward revision to reinvested earnings, and the revision for 2002 reflected upward revisions

to intercompany debt and reinvested earnings that were partly offset by a downward revision to equity capital outflows. Income was revised down \$1.4 billion for 2000, down \$4.0 billion for 2001, and up \$11.5 billion for 2002. Net receipts of royalties and license fees were revised up \$3.0 billion for 2000 (U.S. parents' receipts were revised up \$3.5 billion, and U.S. parents' payments were revised up \$0.5 billion) and \$2.9 billion for 2001 (U.S. parents' receipts were revised up \$3.4 billion, and U.S. parents' payments were revised up \$0.5 billion). Net receipts for other private services were revised up \$0.4 billion for 2000 (U.S. parents' receipts were revised up \$3.3 billion, and U.S. parents' payments were revised up \$2.8 billion) and \$0.2 billion for 2001 (U.S. parents' receipts were revised up \$3.5 billion, and U.S. parents' payments were revised up \$3.3 billion).

Technical Note

The estimates for 1999–2002 of the U.S. direct investment position abroad at yearend and the estimates of capital flows, income, and services transactions presented here incorporate the results of BEA's 1999 benchmark survey of U.S. direct investment abroad (USDIA); the previous benchmark survey covered 1994. The revisions to the estimates for 2000 forward also reflect the incorporation of new or revised data from BEA's quarterly and annual surveys of USDIA.

Benchmark surveys are normally conducted once every 5 years and cover virtually the entire universe of foreign affiliates of U.S. direct investors in terms of value.⁷ In the 1999 survey, direct investors were required to file reports for all affiliates that had total assets, sales, or net income (or loss) greater than \$7 million in their 1999 fiscal year. Affiliates that did not meet these criteria were exempt from the survey.⁸

In nonbenchmark years, the estimates of the direct investment position and balance of payments flows are derived from data reported quarterly for all affiliates above a size-exemption level and from estimates for smaller affiliates. The estimates for affiliates not reported in the quarterly surveys are derived by extrapolating data from the benchmark survey or from the prior quarterly survey, using movements in the data for a matched sample of affiliates that reported in both prior and current quarterly surveys.

6. No data are shown for 2002 in the direct investment position columns because estimates for 2002 were first published in the July 2003 SURVEY and have not been revised. No data are shown for royalties and license fees and other private services for 2002 because estimates net of withholding taxes are presented here for the first time.

7. For a detailed description of the methodology underlying USDIA statistics, including basic concepts and definitions, see *U.S. Direct Investment Abroad: 1994 Benchmark Survey, Final Results*. (Washington, DC: U.S. Government Printing Office, May 1998). (The final results of the 1999 benchmark survey of U.S. direct investment abroad, including an updated methodology, is scheduled to be published in the coming months.)

8. In contrast to the practice in past benchmark surveys of U.S. direct investment abroad, the results for this survey, as well as the estimates linked to it, include estimates for all items for the affiliates that were exempt. These estimates were based on a few major data items (including assets, sales, and position) supplied for affiliates in the claims for exemption. The exempt affiliates accounted for only 0.5 percent of the total assets of the reported affiliates.

Benchmarking the 1999 quarterly survey data

The benchmarking procedure for 1999 consisted of a series of four steps that mainly compared the data reported in the quarterly sample survey of USDIA with the data reported in the 1999 benchmark survey. First, for affiliates that were reported in both surveys, the data from the quarterly surveys were reconciled with the data

from the benchmark survey. Significant discrepancies were investigated and resolved, usually in favor of the benchmark survey data, which are generally considered more accurate because they are reported later than the quarterly survey data. Additionally, because the benchmark survey data are more comprehensive, they can be more thoroughly edited and cross-checked.

1. In the previously published estimates, affiliates that have operations spanning more than one country and that are engaged in petroleum shipping, other water transportation, or offshore oil and gas drilling are classified in a separate geographic category "International." Beginning with the revised estimates for 1999, these affiliates are classified in the country of residence of the operator of the ship or the equipment. In most cases the country of the operator is the same as the country of incorporation. Because there are no revised estimates in "International," dashes are shown in the "Revised" columns.

2. No data are shown for 2002 in the direct investment position columns because estimates for 2002 were first published in the July 2003 Survey and have not been revised. No data are shown for royalties and license fees and other private services for 2002 because estimates net of withholding taxes are presented in this report for the first time.

NOTE: In this table, unlike in the international transactions accounts, capital outflows and income are shown without a current-cost adjustment and income and royalties and license fees are shown net of withholding taxes.

As part of this reconciliation process, the benchmark survey data were adjusted from a fiscal year basis to a calendar year basis—that is, from the basis on which the data were reported to the basis on which the U.S. international transactions accounts and the international investment position of the United States are compiled. For about three-fourths of the affiliates, the fiscal year coincided with the calendar year, so no adjustment was necessary.⁹ For affiliates whose fiscal year did not coincide with the calendar year but whose data were reported on both the quarterly survey and the benchmark survey, the sum of the quarterly survey data for the four quarters of the affiliate's 1999 fiscal year was reconciled with the fiscal year 1999 total reported in the benchmark survey. The calendar year estimates for these affiliates were derived as the sum of (1) the reconciled quarterly data for the quarters that were included in both fiscal and calendar year 1999 and (2) the data from the quarterly survey for the calendar quarters not covered by the benchmark survey.

Second, data for affiliates that were not reported in the benchmark survey but that were reported (or were estimated based on reports previously filed) in the quarterly survey were added to the quarterly estimates.

Third, data were removed from the quarterly estimates for any affiliates that the benchmark survey indicated had either left the direct investment universe or been consolidated into other affiliates since the 1994 benchmark survey (and whose exit or consolidation had not already been captured by BEA's quarterly and annual surveys).

Fourth, the data for affiliates that were reported in the benchmark survey (or whose data were estimated based on exemption claims from that survey) but that were not reported in the quarterly and annual surveys were added to the quarterly estimates. The data from the benchmark survey for fiscal year 1999 were used as the estimates for calendar year 1999 and in general were distributed evenly among the four calendar quarters of the year.

Estimates for 2000 forward

For 2000 forward, universe estimates of the direct investment position and balance of payments flows were generally derived from (1) data reported in the quarterly

surveys for the year being estimated for a sample of the affiliates that were also reported in the 1999 benchmark survey, (2) data reported in the quarterly surveys for the year being estimated for affiliates that entered the direct investment universe since the 1999 benchmark survey and that met the reporting criteria for the quarterly survey, and (3) estimates for affiliates that were not reported in the quarterly surveys for the year being estimated.

Conceptually, the estimates of the direct investment position and the balance of payments flows cover the affiliate universe. To ensure coverage that is as complete as that in the 1999 benchmark survey, estimates are prepared for affiliates that were reported in the benchmark survey (or whose 1999 data were estimated based on quarterly reports or on information filed on exemption claims from that survey) but that were not reported in the quarterly surveys for the year 2000 or later, either because they were exempt or because they should have been reported but were not. The estimates for these affiliates are derived by extrapolating the data previously reported by or estimated for them—such as in the benchmark survey—based on movements in the data reported in the subsequent quarters by a matched sample of affiliates. (External, publicly available information is also used in preparing the estimates.) The universe estimates are derived by adding the estimates for these affiliates to the data for the affiliates that were reported in the quarterly survey.

This procedure is applied to all data items except intercompany debt flows and equity capital increases and decreases. The estimates of intercompany debt flows are derived as the change in the sample data for the intercompany debt positions reported in the quarterly surveys, supplemented in some cases with data from the annual survey of USDIA. Equity capital increases and decreases are expanded at the aggregate level by using a ratio of current quarter reported flows to the prior quarter equity position of all affiliates that were reported in the current quarter. This ratio is multiplied by the equity position in the prior quarter for affiliates that were not reported in the current quarter. The result is added to the current quarter's reported flows to derive total equity increases and decreases. The estimated flows are then allocated to the largest country and industry cells.

Tables 1–19 follow.

9. The fiscal year data for the direct investment position, capital flows, income, royalties and license fees, and charges for other services will be available in the coming months when the final results of the 1999 benchmark survey of U.S. direct investment are published.

1. On a historical-cost basis, direct investment income excludes capital gains and losses and is computed without a current-cost adjustment to earnings; it equals the sum of lines 9 and 14 of table 2. The rate of return based on historical cost equals this measure of income divided by the average of the beginning- and end-of-year historical-cost direct investment positions. In accordance with international guidelines, this measure of income, like the other measures shown in this table, is recorded gross (before deduction) of U.S. and foreign withholding taxes on distributed earnings and interest. However, it differs from the measure disaggregated by country and industry in subsequent tables, which is recorded net (after deduction) of withholding taxes, because withholding tax data are not available by country or industry.

2. On a current-cost basis, direct investment income excludes capital gains and losses and includes a current-cost adjustment to earnings; the latter adjusts depreciation, depletion, and expensed petroleum explo-

ration and development costs to reflect current-period prices, and to more closely align income earned in a given period with charges against income in the same period, as required for the national and international economic accounts. Income on a current-cost basis equals line 1 of table 2. The rate of return based on current cost equals this measure of income divided by the average of the beginning- and end-of-year current-cost direct investment positions.

3. On a market-value basis, direct investment income measures financial return to investors; thus, it includes capital gains and losses of the affiliate but excludes the current-cost adjustment, which is an economic accounting adjustment, and currency translation adjustments. It is derived as line 1 minus line 8 of table 2, plus the total in column 12 of table 6. The rate of return based on market value equals this measure of income divided by the average of the beginning- and end-of-year direct investment positions at market value.

39 U.S. parents' payments (IT table 1, part of line 27, with sign reversed; also shown in the following tables).....	15,480	16,268	16,773	17,530

1. Withholding taxes on "other" private services transactions between U.S. parents and their foreign affiliates are assumed to be negligible, and no estimates of them are made. Therefore, there is no difference between the before-tax estimates shown in the international transactions accounts and the after-tax estimates shown in the following tables.

NOTE: This table reconciles the estimates for which country and industry detail are presented in this report with the aggregate estimates presented in the U.S. international transactions accounts in the July 2003 SURVEY OF CURRENT BUSINESS (see "U.S. International Transactions, First Quarter 2003," SURVEY 83 (July 2003): 49-

113). In the international transactions accounts, the earnings component of direct investment income and the reinvested earnings component of capital outflows are adjusted to a current-cost basis, and direct investment current-account items are adjusted to be gross (before deduction) of U.S. and foreign withholding taxes. These adjustments are not made to the estimates in tables 4-19 in this report, because the source data needed to make the adjustments by country and industry are not available.

1. Reinvested earnings divided by earnings.

2. Reinvestment ratio is not defined because reinvested earnings are negative.

NOTE: In this table, distributed earnings are shown before deduction of withholding taxes. Unlike in the international transactions accounts, earnings and reinvested earnings are shown without a current-cost adjustment.

1. Consists of service charges, rentals for the use of tangible property, and film and television tape rentals. In 2002, U.S. parents' receipts of service charges were \$20,407 million, receipts of rentals for the use of tangible property were \$1,872 million, and receipts of television and tape rentals were \$2,916 million; U.S. parents' payments were \$17,436 million, \$94

million, and \$1 million, respectively.

NOTE: In this table, unlike in the international transactions accounts, royalties and license fees are shown net of withholding taxes.

Petroleum ¹	88,111	89,977	93,085	91,884	11,608	7,672	12,750	2,914	10,344	16,769	12,240	10,209

1. Petroleum consists of oil and gas extraction; support activities for oil and gas extraction; petroleum and coal products manufacturing; petroleum and petroleum products wholesale trade; gasoline stations; petroleum tanker operations; pipeline transportation of crude oil, refined petroleum products, and natural gas; and petroleum storage for hire.

Note: In this table, unlike in the international transactions accounts, income and capital outflows are shown without a current-cost adjustment, and income is shown net of withholding taxes.

NOTES. The countries shown within each major area are those for which the 2002 direct investment position in holding companies exceeded \$3.0 billion and for which more than 20 percent of the total 2002 direct investment position was

accounted for by holding companies. In this table, unlike in the international transactions accounts, income and capital outflows are shown without a current-cost adjustment, and income is shown net of withholding taxes.

Schedule of BEA News Releases in 2004

January	U.S. International Trade in Goods and Services, November 2003*	Jan. 14	8:30 a.m.
	State Personal Income, 3rd quarter 2003	Jan. 27	8:30 a.m.
	Gross Domestic Product, 4th quarter 2003 (advance)	Jan. 30	8:30 a.m.
February	Personal Income and Outlays, December 2003	Feb. 2	8:30 a.m.
	U.S. International Trade in Goods and Services, December 2003*	Feb. 13	8:30 a.m.
	Gross Domestic Product, 4th quarter 2003 (preliminary)	Feb. 27	8:30 a.m.
March	Personal Income and Outlays, January 2004	Mar. 1	8:30 a.m.
	U.S. International Trade in Goods and Services, January 2004*	Mar. 10	8:30 a.m.
	U.S. International Transactions, 4th quarter 2003	Mar. 12	8:30 a.m.
	Tourism Satellite Accounts, 4th quarter 2003	Mar. 15	8:30 a.m.
	Gross Domestic Product, 4th quarter 2003 (final) and Corporate Profits, 4th quarter 2003	Mar. 25	8:30 a.m.
	Personal Income and Outlays, February 2004	Mar. 26	8:30 a.m.
April	U.S. International Trade in Goods and Services, February 2004*	April 14	8:30 a.m.
	State Personal Income, 4th quarter 2003, State Per Capita Personal Income, 2003, and Revision, 1969–2002	April 27	8:30 a.m.
	Gross Domestic Product, 1st quarter 2004 (advance)	April 29	8:30 a.m.
	Personal Income and Outlays, March 2004	April 30	8:30 a.m.
May	U.S. International Trade in Goods and Services, March 2004*	May 12	8:30 a.m.
	Local Area Personal Income, 1969–2002	May 25	8:30 a.m.
	Gross Domestic Product, 1st quarter 2004 (preliminary) and Corporate Profits, 1st quarter 2004 (preliminary)	May 27	8:30 a.m.
	Personal Income and Outlays, April 2004	May 28	8:30 a.m.
June	Foreign Investors' Spending to Acquire or Establish U.S. Businesses, 2003	June 1	8:30 a.m.
	Tourism Satellite Accounts, 1st quarter 2004	June 10	8:30 a.m.

	Gross Domestic Product by Industry, 2003	June 17	8:30 a.m.
	U.S. International Transactions, 1st quarter 2004	June 18	8:30 a.m.
	Gross Domestic Product, 1st quarter 2004 (final) and Corporate Profits, 1st quarter 2004 (revised)	June 25	8:30 a.m.
	Personal Income and Outlays, May 2004	June 28	8:30 a.m.
	State Personal Income, 1st quarter 2004	June 29	8:30 a.m.
International Investment Position of the United States, 2003	June 30	8:30 a.m.	
July	U.S. International Trade in Goods and Services, May 2004*	July 13	8:30 a.m.
	Gross Domestic Product, 2nd quarter 2004 (advance)	July 30	8:30 a.m.
August	Personal Income and Outlays, June 2004	Aug. 3	8:30 a.m.
	U.S. International Trade in Goods and Services, June 2004*	Aug. 13	8:30 a.m.
	Gross Domestic Product, 2nd quarter 2004 (preliminary) and Corporate Profits, 2nd quarter 2004 (preliminary)	Aug. 27	8:30 a.m.
	Personal Income and Outlays, July 2004	Aug. 30	8:30 a.m.
September	Tourism Satellite Accounts, 2nd quarter 2004	Sept. 8	8:30 a.m.
	U.S. International Trade in Goods and Services, July 2004*	Sept. 10	8:30 a.m.
	U.S. International Transactions, 2nd quarter 2004	Sept. 14	8:30 a.m.
	State Personal Income, 2nd quarter 2004	Sept. 28	8:30 a.m.
	Gross Domestic Product, 2nd quarter 2004 (final) and Corporate Profits, 2nd quarter 2004 (revised)	Sept. 29	8:30 a.m.
	Personal Income and Outlays, August 2004	Sept. 30	8:30 a.m.
October	U.S. International Trade in Goods and Services, August 2004*	Oct. 14	8:30 a.m.
	Gross Domestic Product, 3rd quarter 2004 (advance)	Oct. 29	8:30 a.m.
November	Personal Income and Outlays, September 2004	Nov. 1	8:30 a.m.
	U.S. International Trade in Goods and Services, September 2004*	Nov. 10	8:30 a.m.
	Gross Domestic Product, 3rd quarter 2004 (preliminary) and Corporate Profits, 3rd quarter 2004 (preliminary)	Nov. 30	8:30 a.m.
December	Personal Income and Outlays, October 2004	Dec. 1	8:30 a.m.
	U.S. International Trade in Goods and Services, October 2004*	Dec. 14	8:30 a.m.
	Gross State Product by Industry, 1977–2002	Dec. 15	8:30 a.m.
	U.S. International Transactions, 3rd quarter 2004	Dec. 16	8:30 a.m.
	Tourism Satellite Accounts, 3rd quarter 2004	Dec. 20	8:30 a.m.
	State Personal Income, 3rd quarter 2004	Dec. 21	8:30 a.m.
	Gross Domestic Product, 3rd quarter 2004 (final) and Corporate Profits, 3rd quarter 2004 (revised)	Dec. 22	8:30 a.m.
	Personal Income and Outlays, November 2004	Dec. 23	8:30 a.m.

*Joint release by Bureau of the Census and the Bureau of Economic Analysis.

BEA Current and Historical Data

National, International, and Regional Data

This section presents an extensive selection of economic statistics prepared by the Bureau of Economic Analysis (BEA) and a brief selection of collateral statistics prepared by other Government agencies and private organizations. Series that originate in Government agencies are not copyrighted and may be reprinted freely. Series from private sources are provided through the courtesy of the compilers and are subject to their copyrights.

BEA's economic statistics are available on BEA's Web site at <www.bea.gov>. The site contains data, articles, news releases, and other information from BEA's national, industry, international, and regional programs.

The tables present annual [A], quarterly [Q], and monthly [M] data

National Data

A. Selected NIPA tables [A, Q]	
S. Summary tables.....	D-2
1. National product and income	D-3
2. Personal income and outlays	D-7
3. Government current receipts and expenditures....	D-8
4. Foreign transactions.....	D-12
5. Saving and investment	D-14
6. Income and employment by industry.....	D-17
7. Quantity and price indexes.....	D-18
8. Supplemental tables	D-25
B. Other NIPA and NIPA-related tables	
B.1 Personal income [A, M]	D-30
B.2 Disposition of personal income [A, M].....	D-30
B.3 Gross domestic product by industry [A].....	D-31
B.4 Personal consumption expenditures by type [A].....	D-32
B.5 Private fixed investment in structures by type [A].....	D-33
B.6 Private fixed investment in equipment and software by type [A].....	D-33
B.7 Compensation and wage and salary accruals by industry [A].....	D-34
B.8 Employment by industry [A].....	D-35
B.9 Wage and salary accruals by employee and by industry [A].....	D-36
B.10 Farm sector output, gross product, and national income [A].....	D-37
B.11 Housing sector output, gross product, and national income [A].....	D-37
B.12 Net stock of private fixed assets by type [A].....	D-38
C. Historical measures	
C.1 GDP and other major NIPA aggregates	D-39
D. Domestic perspectives [A, Q, M].....	D-42
E. Charts	
Selected NIPA series.....	D-44
Other indicators of the domestic economy	D-50

International Data

F. Transactions tables	
F.1 U.S. international transactions in goods and services [A, M]	D-52
F.2 U.S. international transactions [A, Q]	D-53
F.3 U.S. international transactions by area [Q]	D-54
F.4 Private services transactions [A].....	D-57
G. Investment tables [A]	
G.1 U.S. international investment position	D-58
G.2 USDIA: Selected items	D-59
G.3 Selected financial and operating data of foreign affiliates of U.S. companies.....	D-60
G.4 FDIUS: Selected items.....	D-61
G.5 Selected financial and operating data of U.S. affiliates of foreign companies.....	D-62
H. International perspectives [A, Q, M]	D-63
I. Charts	
The United States in the international economy.....	D-64

Regional Data

J. State and regional tables	
J.1 Personal income [Q].....	D-65
J.2 Personal income and per capita personal income [A]	D-66
J.3 Disposable personal income and per capita disposable personal income [A]	D-67
J.4 Gross state product [A]	D-68
K. Local area table	
K.1 Personal income and per capita personal income by metropolitan area [A]	D-69
L. Charts	
Selected regional estimates	D-71

Appendixes

A: Additional information about the NIPA estimates	
Statistical conventions.....	D-73
Reconciliation tables [A, Q]	D-74
B: Suggested reading.....	D-75

National Data

A. Selected NIPA Tables

The tables in this section include the most recent estimates of gross domestic product and its components; these estimates were released on August 28, 2003, and include the "preliminary" estimates for the second quarter of 2003.

The selected set of NIPA tables shown in this section presents quarterly estimates, which are updated monthly. In most of these tables, annual estimates are also shown.

The news release on gross domestic product is available within minutes of the time of release, and the "Selected NIPA Tables" are available later that day, on BEA's Web site <www.bea.gov>.

The "Selected NIPA Tables" are also available on printouts or diskettes from BEA. To order, call the BEA Order Desk at 1-800-704-0415 (outside the United States, 202-606-9666).

S. Summary Tables

Table S.1. Summary of Percent Change From Preceding Period in Real Gross Domestic Product and Related Measures

[Percent]

	2001	2002	Seasonally adjusted at annual rates				
			2002			2003	
			II	III	IV	I	II
Gross domestic product..	.3	2.4	1.3	4.0	1.4	1.4	3.1
Personal consumption expenditures.....	2.5	3.1	1.8	4.2	1.7	2.0	3.8
Durable goods.....	6.0	7.3	2.0	22.8	-8.2	-2.0	24.1
Nondurable goods.....	2.0	3.2	-1	1.0	5.1	6.1	1.1
Services.....	2.0	2.2	2.7	2.3	2.2	.9	1.5

Residual	22.6	19.9	25.1	12.1	22.2	25.2	22.7

NOTE: Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Percent changes from preceding period for selected items in this table are shown in table 8.1; contributions to the percent change in real gross domestic product are shown in table 8.2.

Chain-type quantity indexes for the series in this table are shown in table 7.1.

1. Estimates for durable goods and nondurable goods for 1997 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

Note. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line following change in private inventories is the difference between gross domestic product and the sum of final sales of domestic product and of change in private inventories; the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, services, and of structures.

Percent changes from preceding period for gross domestic product and for final sales of domestic product are shown in table 8.1.

Chain-type quantity indexes for the series in this table are shown in table 7.17.

Table 1.6. Relation of Real Gross Domestic Product, Real Gross Domestic Purchases, and Real Final Sales to Domestic Purchasers

[Billions of chained (1996) dollars]

Gross domestic product	9,214.5	9,439.9	9,392.4	9,485.6	9,518.2	9,552.0	9,625.5
Less: Exports of goods and services.....	1,076.1	1,058.8	1,065.5	1,077.7	1,061.6	1,058.1	1,054.9
Plus: Imports of goods and services.....	1,492.0	1,547.4	1,552.9	1,565.7	1,593.8	1,568.4	1,598.5
Equals: Gross domestic purchases	9,600.7	9,889.8	9,840.8	9,934.7	10,005.5	10,020.7	10,123.3
Less: Change in private inventories.....	-61.4	5.2	4.9	18.8	25.8	4.8	-20.9
Equals: Final sales to domestic purchasers	9,644.9	9,874.1	9,826.0	9,906.1	9,970.1	10,004.7	10,128.1

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

Percent changes from preceding period for selected series in this table are shown in table 8.1.

Chain-type quantity indexes for selected series in this table are shown in table 7.2.

Table 1.8. Real Gross Domestic Product by Sector

[Billions of chained (1996) dollars]

Gross domestic product	9,214.5	9,439.9	9,392.4	9,485.6	9,518.2	9,552.0	9,625.5
Business ¹	7,838.3	8,032.8	7,989.2	8,075.1	8,099.8	8,127.2	8,197.5
Nonfarm ²	7,724.7	7,917.7	7,876.8	7,961.0	7,983.9	8,010.7	8,082.6
Nonfarm less housing.....	7,012.9	7,208.9	7,157.0	7,252.6	7,285.5	7,311.9	7,395.0
Housing.....	712.6	711.7	721.0	711.7	703.2	703.8	694.7
Farm.....	114.3	114.7	110.8	112.9	115.5	116.2	113.3
Households and institutions	398.7	407.7	406.4	409.0	411.8	414.0	415.2
Private households.....	10.1	8.8	8.8	8.9	9.0	9.1	9.2
Nonprofit institutions.....	388.7	398.9	397.7	400.3	402.9	405.0	406.1
General government ³	978.5	1,000.9	998.1	1,003.2	1,008.1	1,012.2	1,015.0
Federal.....	291.3	297.5	296.0	298.5	301.3	304.7	308.6
State and local.....	687.0	703.1	701.7	704.4	706.5	707.1	706.0
Residual.....	-2.4	-3.7	-6.1	-3.7	-5.7	-5.8	-7.4

1. Equals gross domestic product less gross product of households and institutions and of general government.

2. Equals gross domestic business product less gross farm product.

3. Equals compensation of general government employees plus general government consumption of fixed capital as shown in table 3.8.

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Chain-type quantity indexes for the series in this table are shown in table 7.14.

Gross national income ²	9,344.5	9,532.0	9,526.0	9,552.1	9,582.4	9,626.4	9,709.0
Net domestic product	7,905.4	8,055.8	8,017.0	8,085.5	8,103.0	8,123.2	8,181.6

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.

2. Gross national income deflated by the implicit price deflator for gross national product.

NOTE. Except as noted in footnotes 1 and 2, chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

The chain-type quantity index for gross national product is shown in table 7.3.

Table 1.11. Command-Basis Real Gross National Product

[Billions of chained (1996) dollars]

Gross national product	9,237.3	9,433.5	9,376.7	9,477.9	9,512.1	9,544.7	9,629.0
<i>Less:</i> Exports of goods and services and income receipts from the rest of the world ...	1,366.5	1,307.1	1,311.9	1,334.2	1,314.4	1,305.5	1,303.9
<i>Plus:</i> Command-basis exports of goods and services and income receipts from the rest of the world ¹	1,410.0	1,344.4	1,345.6	1,365.6	1,345.4	1,316.2	1,328.0
Equals: Command-basis gross national product	9,280.9	9,470.8	9,410.3	9,509.3	9,543.1	9,555.4	9,653.1
Addendum:							
Terms of trade ²	103.2	102.8	102.6	102.4	102.4	100.8	101.8

1. Exports of goods and services and income receipts deflated by the implicit price deflator for imports of goods and services and income payments.

2. Ratio of the implicit price deflator for exports of goods and services and income receipts to the corresponding implicit price deflator for imports divided by 100.

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

Percent changes from preceding period for gross national product are shown in table 8.1.

Chain-type quantity indexes for the series in this table are shown in table 7.3.

Net product ³	4,469.9	4,581.2	4,583.3	4,589.4	4,615.9	4,644.1	4,712.5

1. Effective November 26, 2002, the estimates of chained-dollar gross product of nonfinancial corporate business beginning with 1999 have been revised to reflect the 2002 annual revision to the gross product price index for nonfinancial industries.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net product of nonfinancial corporate business is the difference between the gross product and the consumption of fixed capital.

2. Personal Income and Outlays

Residual	-23.6	-37.2	-34.9	-40.3	-39.5	-38.4	-51.3
Addenda:							
Energy goods and services ¹ ..	285.6	293.9	290.1	293.3	301.6	299.9	292.1
Personal consumption expenditures less food and energy	5,204.5	5,380.3	5,353.5	5,419.6	5,426.1	5,441.5	5,511.2

1. Consists of gasoline, fuel oil, and other energy goods and of electricity and gas.

NOTE: Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Chain-type quantity indexes for the series in this table are shown in table 7.4.

Contributions to the percent change in real personal consumption expenditures are shown in table 8.3.

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines in the addenda.

See footnotes to table 3.7.

Chain-type quantity indexes for the series in this table are shown in table 7.11. Contributions to percent change in real government consumption expenditures and gross investment are shown in table 8.6.

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

2. Consumption expenditures for durable goods excludes expenditures classified as investment, except for goods transferred to foreign countries by the Federal Government.

3. Compensation of government employees engaged in new own-account investment and related expenditures for goods and services are classified as investment in structures and in software. The compensation of all general government employees is shown in the addenda.

4. Consumption of fixed capital, or depreciation, is included in government consumption expenditures as a partial measure of the value of the services of general government fixed assets; use of depreciation assumes a zero net return on these assets.

5. Beginning with 2001, in accordance with the Consolidated Appropriations Act of 2001, includes compensation of employees of Indian tribal governments reclassified from the private sector.

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.

2. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.

* The chained-dollar estimates for computers can be used to accurately measure the real growth rate of this component. However, for computers, or for other components that exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series.

NOTE: Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. For exports and for imports, the residual line is the difference between the aggregate line and the sum of the most detailed lines.

Chain-type quantity indexes for the series in this table are shown in table 7.10.

Contributions to the percent change in real exports and in real imports of goods and services are shown in table 8.5.

See footnotes to table 4.3.

5. Saving and Investment

Other structures	146.9	151.6	151.0	151.3	154.4	153.5	158.4
Equipment	9.5	9.7	9.7	9.7	9.8	9.9	10.4
Residual	-62.2	-99.2	-90.0	-111.6	-114.6	-125.7	-155.2

1. Includes new computers and peripheral equipment only. The chained-dollar estimates for computers can be used to accurately measure the real growth rate of this component. However, for computers, or for other components that exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 8.4.

2. Excludes software "embedded," or bundled, in computers and other equipment.

NOTE: Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Chain-type quantity indexes for the series in this table are shown in table 7.6.

Contributions to the percent change in real private fixed investment are shown in table 8.4.

1. This series is derived from the Census Bureau series "current cost inventories."

2. The inventory valuation adjustment (IVA) shown in this table differs from the IVA that adjusts business incomes. The IVA in this table reflects the mix of methods (such as first-in, first-out and last-in, first-out) underlying inventories derived primarily from Census Bureau statistics (see footnote 1). This mix differs from that underlying business income derived primarily from Internal Revenue Service statistics.

NOTE: Estimates in this table are based on the North American Industry Classification System (NAICS).

NOTE: Estimates in this table are based on the North American Industry Classification System (NAICS). Chained (1996) dollar series for real change in private inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Nonfarm inventories to final sales of goods and structures.....	3.49	3.48	3.51	3.53	3.47

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in the private inventories component of GDP. The former is the difference between two inventory stocks, each valued at its respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas, the change in private inventories is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross product of households and institutions and of general government, and it includes a small amount of final sales by farm and by government enterprises.

NOTE: Estimates in this table are based on the North American Industry Classification System (NAICS).

Nonfarm inventories to final sales of goods and structures.....	3.64	3.61	3.64	3.61	3.56

1. Inventories are as of the end of the quarter. The quarter-to-quarter changes calculated from this table are at quarterly rates, whereas the change in private inventories component of GDP is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross product of households and institutions and of general government, and it includes a small amount of final sales by farm and by government enterprises.

NOTE: Estimates in this table are based on the North American Industry Classification System (NAICS). Chained (1996) dollar inventory series are calculated to ensure that the chained (1996) dollar change in inventories for 1996 equals the current-dollar change in inventories for 1996 and that the average of the 1995 and 1996 end-of-year chain-weighted and fixed-weighted inventories are equal. Chained (1996) dollar final sales are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines for inventories.

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

2. Consumption expenditures for durable goods excludes expenditures classified as investment, except for goods transferred to foreign countries by the Federal Government.

3. Compensation of government employees engaged in new own-account investment and related expenditures for goods and services are classified as investment in structures and in software. The compensation of all

general government employees is shown in the addenda.

4. Consumption of fixed capital, or depreciation, is included in government consumption expenditures as a partial measure of the value of the services of general government fixed assets; use of depreciation assumes a zero net return on these assets.

5. Beginning with 2001, in accordance with the Consolidated Appropriations Act of 2001, includes compensation of employees of Indian tribal governments reclassified from the private sector.

Personal consumption expenditures less food and energy.....	2.35	2.75	1.94	4.07	.41	.93	4.18

1. Consists of gasoline, fuel oil, and other energy goods, and of electricity and gas.
 NOTE: The quantity indexes on which the estimates in this table are based are shown in table 7.4. The estimates in this table differ from those in table 8.2 because this table shows contributions to real personal consumption expenditures, whereas table 8.2 shows contributions to real gross domestic product.

1. Excludes software "embedded," or bundled, in computers and other equipment.

2. For some components of final sales of computers, includes computer parts.

NOTE: The quantity indexes on which the estimates in this table are based are shown in tables 7.1, 7.2, 7.4, 7.6, 7.9, 7.11, and 7.17.

Table 8.4. Contributions to Percent Change in Real Private Fixed Investment by Type

Other.....	.07	.28	2.32	.69	.43	-3.76	2.26
Imports of services ¹	-.08	.52	-.10	.52	2.14	-.67	-2.69

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment were reclassified from goods to services.

NOTE: The quantity indexes on which the estimates in this table are based are shown in table 7.10. The estimates in this table differ from those in table 8.2 because this table shows contributions to real exports and to real imports, whereas table 8.2 shows contributions to real gross domestic product. Because imports are subtracted in the calculation of gross domestic product, the contributions of components of real imports have opposite signs in this table and in table 8.2.

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

2. Consumption expenditures for durable goods excludes expenditures classified as investment, except for goods transferred to foreign countries by the Federal Government.

3. Compensation of government employees engaged in new own-account investment and related expenditures for goods and services are classified as investment in structures and in software.

4. Consumption of fixed capital, or depreciation, is included in government consumption expenditures as a partial measure of the value of the services of general government fixed assets; use of depreciation assumes a zero net return on these assets.

NOTE: The quantity indexes on which the estimates in this table are based are shown in table 7.11. The estimates in this table differ from those in table 8.2 because this table shows contributions to real government consumption expenditures and gross investment, whereas table 8.2 shows contributions to real gross domestic product.

Sales of imported new autos ³	84.6	87.1	85.1	92.3	87.2	84.8	83.0

1. Except for exports and imports, consists of new trucks only.
2. Consists of final sales and change in private inventories of new autos assembled in the United States.
3. Consists of personal consumption expenditures, private fixed investment, and gross government investment.

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines in the addenda.

Chain-type quantity indexes for the series in this table are shown in table 7.18B.

^p Preliminary.

^r Revised.

1. Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

2. Population is the total population of the United States, including the Armed Forces overseas and the institutionalized population. The monthly estimate is the average of estimates for the first of the month and the first of the following month; the annual estimate is the average of the monthly estimates.

Source: U.S. Bureau of Economic Analysis.

Annual Estimates

Except as noted for table B.3 below, these tables are derived from the NIPA tables that were published in the August and September 2002 issues of the SURVEY OF CURRENT BUSINESS, and the estimates reflect the most recent comprehensive and annual NIPA revisions.

1. The current-dollar statistical discrepancy equals gross domestic product (GDP) measured as the sum of expenditures less gross domestic income—that is, GDP measured as the costs incurred and profits earned in domestic production. The chained (1996) dollar statistical discrepancy equals the current-dollar statistical discrepancy deflated by the implicit price deflator for gross domestic business product.

2. Equals GDP in chained (1996) dollars less the statistical discrepancy and the sum of GDP by industry of the

detailed industries. The value of not allocated by industry reflects the nonadditivity of chained-dollar estimates and the differences in source data used to estimate real GDP by industry and the expenditures measure of real GDP.

NOTE. Estimates are based on the 1987 Standard Industrial Classification. The table is derived from tables 1 and 6 in "Gross Domestic Product by Industry for 1999–2001" in the November 2002 SURVEY.

* Because of rapid changes in relative prices, the chained-dollar estimates for computers are especially misleading as a measure of the contribution or relative importance of this component.

1. Consists of purchases (including tips) of meals and beverages from retail, service, and amusement establishments, hotels, dining and buffet cars, schools, school fraternities, institutions, clubs, and industrial lunchrooms. Includes meals and beverages consumed both on- and off-premise.

2. Includes luggage.

3. Consists of watch, clock, and jewelry repairs, costume and dress suit rental, and miscellaneous personal services.

4. Consists of rent for space and for heating and plumbing facilities, water heaters, lighting fixtures, kitchen cabinets, linoleum, storm windows and doors, window screens, and screen doors, but excludes rent for appliances and furniture and purchases of fuel and electricity.

5. Consists of space rent (see footnote 4) and rent for appliances, furnishings, and furniture.

6. Consists of transient hotels, motels, clubs, schools, and other group housing.

7. Consists of refrigerators and freezers, cooking ranges, dishwashers, laundry equipment, stoves, room air conditioners, sewing machines, vacuum cleaners, and other appliances.

8. Includes such house furnishings as floor coverings, comforters, quilts, blankets, pillows, picture frames, mirrors, art products, portable lamps, and clocks. Also includes writing equipment and hand, power, and garden tools.

9. Consists largely of textile house furnishings, including piece goods allocated to house furnishing use. Also includes lamp shades, brooms, and brushes.

10. Consists of maintenance services for appliances and house furnishings, moving and warehouse expenses, postage and express charges, premiums for fire and theft insurance on personal property less benefits and dividends, and miscellaneous household operation services.

11. Excludes drug preparations and related products dispensed by physicians, hospitals, and other medical services.

12. Consists of osteopathic physicians, chiropractors, private duty nurses, chiropractors, podiatrists, and others providing health and allied services, not elsewhere classified.

13. Consists of (1) current expenditures (including consumption of fixed capital) of nonprofit hospitals and nursing homes, and (2) payments by patients to proprietary and government hospitals and nursing homes.

14. Consists of (1) premiums, less benefits and dividends, for health, hospitalization, and accidental death and dismemberment insurance provided by commercial insurance carriers, and (2) administrative expenses (including consumption of fixed capital) of nonprofit and self-insured health plans.

15. Consists of premiums, less benefits and dividends, for income loss insurance.

16. Consists of premiums, less benefits and dividends, for privately administered workers' compensation.

17. Consists of (1) operating expenses of commercial life insurance carriers, (2) administrative expenses of private noninsured pension plans and publicly administered government employee retirement plans, and (3) premiums, less benefits and dividends, of fraternal benefit societies. For commercial life insurance carriers, excludes expenses for accident and health insurance and includes profits of stock companies and services furnished without payment by banks, credit agencies, and investment companies. For pension and retirement plans, excludes services furnished without payment by banks, credit agencies, and investment companies.

18. Consists of current expenditures (including consumption of fixed capital) of trade unions and professional associations, employment agency fees, money order fees, spending for classified advertisements, tax return preparation services, and other personal business services.

19. Consists of premiums, less benefits and dividends, for motor vehicle insurance.

20. Consists of baggage charges, coastal and inland waterway fares, travel agencies' fees, and airport bus fares.

21. Consists of admissions to professional and amateur athletic events and to racetracks.

22. Consists of dues and fees excluding insurance premiums.

23. Consists of billiard parlors; bowling alleys; dancing, riding, shooting, skating, and swimming places; amusement devices and parks; golf courses; sightseeing buses and guides; private flying operations; casino gambling; and other commercial participant amusements.

24. Consists of net receipts of lotteries and expenditures for purchases of pets and pet care services, cable TV, film processing, photographic studios, sporting and recreation camps, video cassette rentals, and recreational services, not elsewhere classified.

25. For private institutions, equals current expenditures (including consumption of fixed capital) less receipts—such as those from meals, rooms, and entertainments—accounted for separately in consumer expenditures, and less expenditures for research and development financed under contracts or grants. For government institutions, equals student payments of tuition.

26. For private institutions, equals current expenditures (including consumption of fixed capital) less receipts—such as those from meals, rooms, and entertainments—accounted for separately in consumer expenditures. For government institutions, equals student payments of tuition. Excludes child day care services, which are included in religious and welfare activities.

27. Consists of (1) fees paid to commercial, business, trade, and correspondence schools and for educational services, not elsewhere classified, and (2) current expenditures (including consumption of fixed capital) by research organizations and foundations for education and research.

28. For nonprofit institutions, equals current expenditures (including consumption of fixed capital) of religious, social welfare, foreign relief, and political organizations, museums, libraries, and foundations. The expenditures are net of receipts—such as those from meals, rooms, and entertainments—accounted for separately in consumer expenditures, and excludes relief payments within the United States and expenditures by foundations for education and research. For proprietary and government institutions, equals receipts from users.

29. Beginning with 1981, includes U.S. students' expenditures abroad: these expenditures were \$0.3 billion in 1981.

30. Beginning with 19

Table B.5. Private Fixed Investment in Structures by Type

Residual				-9	-9	-1.0

1. Consists of office buildings, except those constructed at industrial sites and those constructed by utilities for their own use.

2. Consists of stores, restaurants, garages, service stations, warehouses, mobile structures, and other buildings used for commercial purposes.

3. Consists of hotels and motels, buildings used primarily for social and recreational activities, and buildings not elsewhere classified, such as passenger terminals, greenhouses, and animal hospitals.

4. Consists primarily of streets, dams and reservoirs, sewer and water facilities, parks, and airfields.

5. Consists primarily of dormitories and of fraternity and sorority houses.

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Table B.6. Private Fixed Investment in Equipment and Software by Type

	Billions of dollars			Billions of chained (1996) dollars

Sale of equipment scrap	3.3	3.4	2.9			
Equals: Private fixed investment in new equipment and software	932.6	992.7	912.4			

1. Includes new computers and peripheral equipment only. Because of rapid changes in relative prices, the chained-dollar estimates for computers are especially misleading as a measure of the contribution or relative importance of this component.

2. Excludes software "embedded," or bundled, in computers and other equipment.

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

n.e.c. Not elsewhere classified.

1. Beginning with 2001, reflects the reclassification of employees of Indian tribal governments from the private sector in accordance with the Consolidated Appropriations Act of 2001.

2. Reflects the reclassification of air couriers from trucking and warehousing to transportation by air.

3. Consists of museums, botanical and zoological gardens; engineering and management services; and services, not elsewhere classified.

4. Includes Coast Guard.

5. Includes estimates of foreign professional workers and undocumented Mexican migratory workers employed temporarily in the United States.

NOTE: Estimates in this table are based on the 1987 Standard Industrial Classification (SIC).

1. Equals the number of full-time equivalent employees plus the number of self-employed persons. Unpaid family workers are not included.

2. Beginning with 2001, reflects the reclassification of employees of Indian tribal governments from the private sector in accordance with the Consolidated Appropriations Act of 2001.

3. Reflects the reclassification of air couriers from trucking and warehousing to transportation by air.

4. Consists of museums, botanical and zoological gardens; engineering and management services; and

services, not elsewhere classified.

5. Includes Coast Guard.

6. Includes estimates of foreign professional workers and undocumented Mexican migratory workers employed temporarily in the United States.

NOTE: Estimates in this table are based on the 1987 Standard Industrial Classification (SIC).

1. Full-time equivalent employees equals the number of employees on full-time schedules plus the number of employees on part-time schedules converted to a full-time basis. The number of full-time equivalent employees in each industry is the product of the total number of employees and the ratio of average weekly hours per employee for all employees to average weekly hours per employee on full-time schedules.

2. Beginning with 2001, reflects the reclassification of employees of Indian tribal governments from the private sector in accordance with the Consolidated Appropriations Act of 2001.

3. Reflects the reclassification of air couriers from trucking and warehousing to transportation by air.

4. Consists of museums, botanical and zoological gardens; engineering and management services; and services, not elsewhere classified.

5. Includes Coast Guard.

6. Includes estimates of foreign professional workers and undocumented Mexican migratory workers employed temporarily in the United States.

NOTE. Estimates in this table are based on the 1987 Standard Industrial Classification (SIC).

Table B.10. Farm Sector Output, Gross Product, and National Income

	Billions of dollars			Billions of chained (1996) dollars		
	1999	2000	2001	1999	2000	2001
Farm output	207.5	214.3	221.3	244.1	249.2	246.1
Cash receipts from farm marketings	191.4	199.4	200.9	226.2	233.4	224.4
Crops	95.7	99.8	94.3	125.2	130.9	122.9
Livestock	95.7	99.7	106.6	101.1	102.9	101.3
Farm housing	7.2	7.6	8.0	6.1	6.0	5.9
Farm products consumed on farms5	.6	.6	.5	.5	.5
Other farm income	9.9	8.9	10.3	11.8	10.6	12.2
Change in farm inventories	-1.5	-2.2	1.6	-2.0	-2.5	2.0
Crops	-9	-1.6	2.1	-1.4	-2.2	3.6
Livestock	-6	-6	-5	-6	-6	-4
<i>Less: Intermediate goods and services purchased</i>	132.3	136.5	140.7	137.2	133.3	134.6
Intermediate goods and services, other than rent	118.6	122.2	126.1	123.1	119.5	120.8
Rent paid to nonoperator landlords	13.8	14.2	14.7	14.1	13.8	13.8
Equals: Gross farm product	75.2	77.8	80.6	108.1	120.5	114.3
<i>Less: Consumption of fixed capital</i>	28.9	28.7	29.4	27.7	27.0	27.3
Equals: Net farm product	46.3	49.2	51.2	80.9	97.9	89.5
<i>Less: Indirect business tax and nontax liability</i>	5.3	5.4	5.6
<i>Plus: Subsidies to operators</i>	18.4	19.5	17.7
Equals: Farm national income	59.3	63.3	63.2
Compensation of employees	19.3	19.3	21.5
Wage and salary accruals	16.5	16.6	18.4
Supplements to wages and salaries	2.9	2.7	3.1
Proprietors' income and corporate profits with inventory valuation and capital consumption adjustments	29.6	33.2	30.9
Proprietors' income	27.7	22.6	19.0
Corporate profits	1.9	10.6	11.8
Net interest	10.3	10.9	10.8

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

Table B.11. Housing Sector Output, Gross Product, and National Income

	Billions of dollars			Billions of chained (1996) dollars		
	1999	2000	2001	1999	2000	2001
Housing output ¹	876.4	920.3	976.0	802.5	817.2	833.6
Nonfarm housing	869.2	912.7	968.1	796.4	811.2	827.8
Owner-occupied	666.4	704.9	751.0	610.7	627.3	643.5
Tenant-occupied	202.8	207.8	217.1	185.8	184.0	184.3
Farm housing	7.2	7.6	8.0	6.1	6.0	5.9
<i>Less: Intermediate goods and services consumed</i>	116.9	116.3	138.4	105.5	101.3	115.9
Equals: Gross housing product	759.5	804.0	837.6	697.0	716.1	717.5
Nonfarm housing	753.6	797.8	831.1	691.9	711.0	712.6
Owner-occupied	576.3	615.5	642.3	529.1	549.9	552.1
Tenant-occupied	177.4	182.2	188.8	162.8	161.1	160.5
Farm housing	5.9	6.3	6.5	5.1	5.1	4.9
<i>Less: Consumption of fixed capital</i>	145.4	152.5	166.1	132.2	132.7	140.0
Capital consumption allowances	77.8	81.8	88.4
<i>Less: Capital consumption adjustment</i>	-67.6	-70.7	-77.7
Equals: Net housing product	614.1	651.5	671.4	478.7	494.5	489.4
<i>Less: Indirect business tax and nontax liability plus business transfer payments</i>	135.7	140.7	146.0
<i>Plus: Subsidies less current surplus of government enterprises</i>	23.7	23.8	24.3
Equals: Housing national income	502.2	534.6	549.8
Compensation of employees	10.0	10.9	11.3
Proprietors' income with inventory valuation and capital consumption adjustments	19.7	18.5	18.1
Rental income of persons with capital consumption adjustment	130.7	128.1	118.9
Corporate profits with inventory valuation and capital consumption adjustments	4.1	4.1	4.0
Net interest	337.6	373.1	397.5

1. Equals personal consumption expenditures for housing less expenditures for other housing as shown in table B.4.

NOTE. Chained (1996) dollar series are calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

Table B.12. Net Stock of Private Fixed Assets; Equipment, Software, and Structures; by Type

C. Historical Measures

This table is derived from the "GDP and Other Major NIPA Series" tables that were published in the August 2002 issue of the SURVEY OF CURRENT BUSINESS and from the "Selected NIPA Tables" that are published in this issue. (Changes in prices are calculated from indexes expressed to three decimal places.)

Table C.1. GDP and Other Major NIPA Aggregates

[Quarterly estimates are seasonally adjusted at annual rates]

Year and quarter	Billions of chained (1996) dollars			Percent change from preceding period		Chain-type price indexes		Implicit price deflators		Percent change from preceding period			
	Gross domestic product	Final sales of domestic product	Gross national product	Gross domestic product	Final sales of domestic product	Gross domestic product	Gross domestic purchases	Gross domestic product	Gross national product	Chain-type price indexes		Implicit price deflators	
										Gross domestic product	Gross domestic purchases	Gross domestic product	Gross national product

^a Preliminary.^r Revised.

1. Represents gains or losses on foreign-currency-denominated assets due to their revaluation at current exchange rates.

2. Includes changes in coverage, capital gains and losses of direct investment affiliates, and other statistical adjustments to the value of assets.

3. Reflects changes in the value of the official gold stock due to fluctuations in the market price of gold.

4. Reflects changes in gold stock from U.S. Treasury sales of gold medallions and commemorative and bullion coins; also reflects replenishment through open market purchases. These demonetizations/monetizations are not included in international transactions financial flows.

5. Also includes paid-in capital subscriptions to international financial institutions and resources provided to foreigners under foreign assistance programs requiring repayment over several years. Excludes World War I debts that are not being serviced.

6. Includes indebtedness that the borrower may contractually, or at its option, repay with its currency, with a third country's currency, or by delivery of materials or transfer of services.

7. Primarily U.S. Government liabilities associated with military sales contracts and other transactions arranged with or through foreign official agencies.

D Suppressed to avoid disclosure of data of individual companies.

* Less than \$500,000.

1. The industry classification system used to classify the data for U.S. affiliates is based on the North American Industry Classification System. Prior to 1997, the affiliate data were classified using an industry classification system based on the Standard Industrial Classification system.

NOTES: The data in this table are from BEA's annual survey of the operations of U.S. affiliates of foreign companies; see "U.S. Affiliates of Foreign Companies: Operations in 2001," in the August 2003 issue of the SURVEY OF CURRENT BUSINESS.

Size ranges are given in employment cells that are suppressed. The size ranges are: A—1 to 499; F—500 to 999; G—1,000 to 2,499; H—2,500 to 4,999; I—5,000 to 9,999; J—10,000 to 24,999; K—25,000 to 49,999; L—50,000 to 99,999; M—100,000 or more.

H. International Perspectives

The quarterly data in this table are shown in the middle month of the quarter.

1. Figures for the Euro area and for the United Kingdom are in U.S. dollars per euro and per pound sterling, respectively. The rate for the United States is a weighted average of the foreign exchange value of the U.S. dollar against the currencies of a broad group of major U.S. trading partners. For other countries, figures are in currency units per U.S. dollar.

Sources: Exchange rates are from the Board of Governors of the Federal Reserve System. Indexes of stock market prices are calculated from data taken from finance oriented web sites and are rebased

to 2000 = 100 to facilitate comparisons. Other series are drawn from the web sites of the statistical agencies of the countries shown.

NOTE: In 2002, the countries in this table accounted for 62 percent of the value of U.S. imports of goods and 70 percent of the value of U.S. exports of goods. The Euro area consists of Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, and Spain

1. Per capita personal income was computed using midyear population estimates of the Bureau of the Census.

2. Percent change was calculated from unrounded data.

NOTE: The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts (NIPAs) because of differences in coverage,

in the methodologies used to prepare the estimates, and in the timing of the availability of source data. In particular, it differs from the NIPA estimate because, by definition, it omits the earnings of Federal civilian and military personnel stationed abroad and of U.S. residents employed abroad temporarily by private U.S. firms.
Source: Table 1 in "Personal Income by State: First Quarter 2003 and Revised 2002" in the August 2003 issue of the SURVEY OF CURRENT BUSINESS.

Table J.3. Disposable Personal Income and Per Capita Disposable Personal Income for States and Regions

1. Per capita disposable personal income was computed using midyear population estimates of the Bureau of the Census.

2. Percent change was calculated from unrounded data.

NOTE: The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts (NIPAs) because of differences in coverage,

in the methodologies used to prepare the estimates, and in the timing of the availability of source data. In particular, it differs from the NIPA estimate because, by definition, it omits the earnings of Federal civilian and military personnel stationed abroad and of U.S. residents employed abroad temporarily by private U.S. firms.

Source: Table 2 in "Personal Income by State: First Quarter 2003 and Revised 2002" in the August 2003 issue of the SURVEY OF CURRENT BUSINESS.

Table J.4. Gross State Product (GSP) by Industry for States and Regions, 2001

NOTE: Totals shown for the United States differ from the national income and product account estimates of gross domestic product (GDP) because GSP is derived from gross domestic income, which differs from GDP by the statistical discrepancy. In addition, GSP excludes and GDP includes the compensation of Federal civilian and military personnel stationed abroad and government consumption of fixed capital for military structures located abroad and for military equip-

ment, except office equipment. Also, GSP and GDP have different revision schedules.

Source: This table reflects the GSP estimates for 2001 that were released on May 22, 2003. Detailed estimates are available on BEA's Web site at <www.bea.gov> under "State and local area data."

Table K.1. Personal Income and Per Capita Personal Income by Metropolitan Area, 1999-2001-Continued

Table with 18 columns: Area name, Personal income (Millions of dollars, Percent change), Per capita personal income (Dollars, Rank in U.S.), Area name, Personal income (Millions of dollars, Percent change), Per capita personal income (Dollars, Rank in U.S.). Rows list various metropolitan areas like La Crosse, WI-MN; Lafayette, LA; Reno, NV; etc.

1. Per capita personal income was computed using Census Bureau midyear population estimates. Estimates for 2000-2001 reflect county population estimates available as of April 2003.

2. Percent change calculated from unrounded data.

3. The personal income level shown for the United States is derived as the sum of the county estimates. It differs from the estimate of personal income in the national income and product accounts (NIPAs) because of differences in coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data. In particular, it differs from

the NIPA estimate because, by definition, it omits the earnings of Federal civilian and military personnel stationed abroad and of U.S. residents employed abroad temporarily by private U.S. firms.

4. Includes Metropolitan Statistical Areas, Primary Metropolitan Statistical Areas (PMSA's designated by *), and New England County Metropolitan Areas (NECMA's). The New Haven-Bridgeport-Stamford-Danbury-Waterbury, CT NECMA is presented as a PMSA (part of the New York CMSA).

PERSONAL INCOME: PERCENT CHANGE, 2002:IV-2003:I

Appendix A

Additional Information About the NIPA Estimates

Statistical Conventions

Changes in current-dollar GDP measure changes in the market value of goods and services produced in the economy in a particular period. For many purposes, it is necessary to decompose these changes into quantity and price components. To compute the quantity indexes, changes in the quantities of individual goods and services are weighted by their prices. (Quantity changes for GDP are often referred to as changes in “real GDP.”) For the price indexes, changes in the prices for individual goods and services are weighted by quantities produced. (In practice, the current-dollar value and price indexes for most GDP components are determined largely using data from Federal Government surveys, and the real values of these components are calculated by deflation at the most detailed level for which all the required data are available.)

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years. For example, the annual percent change in real GDP in 1997–98 uses prices for 1997 and 1998 as weights, and the 1997–98 annual percent change in the GDP price index uses quantities for 1997 and 1998 as weights. Because the Fisher formula allows for the effects of changes in relative prices and in the composition of output over time, the resulting quantity or price changes are not affected by the substitution bias that is associated with changes in quantities and prices calculated using a fixed-weighted formula.¹ These annual changes are “chained” (multiplied) together to form time series of quantity and price; the percent changes that are calculated from these time series are not affected by the choice of reference period.

The quarterly changes in quantities and prices are calculated with weights from two adjacent quarters. As part of an annual or comprehensive revision, the quarterly indexes through the most recent complete year are adjusted to ensure that the average of the quarterly indexes conforms to the corresponding annual index.

In addition, BEA prepares measures of real GDP and its components in a dollar-denominated form, designated “chained (1996) dollar estimates.” These estimates are computed by multiplying the 1996 current-dollar value of GDP, or of a GDP component, by the corresponding quantity index number. For example, if a current-dollar GDP component equaled \$100 in 1996 and if real output for this component increased by 10 percent in 1997, then the “chained (1996) dollar” value of this com-

ponent in 1997 would be \$110 ($\100×1.10). Note that percentage changes in the chained (1996) dollar estimates and the percentage changes calculated from the quantity indexes are identical, except for small differences due to rounding.

Because of the formula used for calculating real GDP, the chained (1996) dollar estimates for detailed GDP components do not add to the chained-dollar value of GDP or to any intermediate aggregates. A “residual” line is shown as the difference between GDP and the sum of the most detailed components shown in each table. The residual generally is small close to the base period but tends to become larger as one moves further from it. Accurate measures of component contributions to the percentage changes in real GDP and its major components are shown in NIPA tables 8.2–8.6.

BEA also publishes the “implicit price deflator” (IPD), which is calculated as the ratio of current-dollar value to the corresponding chained-dollar value, multiplied by 100; the values of the IPD and of the corresponding “chain-type” price index are very close.

For quarters and months, the estimates are presented at annual rates, which show the value that would be registered if the rate of activity measured for a quarter or a month were maintained for a full year. Annual rates are used so that time periods of different lengths—for example, quarters and years—may be compared easily. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or by 12 (for monthly data).

Percent changes in the estimates are also expressed at annual rates. Calculating these *changes* requires a variant of the compound interest formula:

$$r = \left[\left(\frac{x_t}{x_o} \right)^{m/n} - 1 \right] \times 100,$$

where r is the percent change at an annual rate; x_t is the level of activity in the later period; x_o is the level of activity in the earlier period; m is the periodicity of the data (for example, 1 for annual data, 4 for quarterly, or 12 for monthly); and n is the number of periods between the earlier and later periods (that is, $t - o$).

Quarterly and monthly NIPA estimates are seasonally adjusted, if necessary. Seasonal adjustment removes from the time series the average impact of variations that normally occur at about the same time and in about the same magnitude each year—for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

1. In addition, because the changes in quantities and prices calculated using these weights are symmetric, the product of a quantity index and the corresponding price index is generally equal to the current-dollar index.

Reconciliation Tables

Table 1. Reconciliation of Changes in BEA-Derived Compensation Per Hour with BLS Average Hourly Earnings
[Percent change from preceding period]

	2001	2002	Seasonally adjusted at annual rates					
			2002				2003	
			I	II	III	IV	I	II ^p
BEA-derived compensation per hour of all persons in the nonfarm business sector (less housing)	3.7	2.8	3.7	3.9	2.0	1.6	4.1	3.7
<i>Less:</i> Contribution of supplements to wages and salaries per hour	0.3	0.6	1.3	0.8	0.8	0.9	0.2	0.4
<i>Plus:</i> Contribution of wages and salaries per hour of persons in housing and in nonprofit institutions	-0.1	-0.1	-0.1	0.3	0.4	0.4	-0.1	-0.3
<i>Less:</i> Contribution of wages and salaries per hour of persons in government enterprises, unpaid family workers, and self-employed	0.0	0.0	-0.2	0.1	0.5	0.0	0.1	-0.2
Equals: BEA-derived wages and salaries per hour of all employees in the private nonfarm sector	3.4	2.1	2.5	3.2	1.1	1.1	3.7	3.3
<i>Less:</i> Contribution of wages and salaries per hour of nonproduction workers in manufacturing	-0.1	0.0	-0.2	0.2	0.4	0.2	-0.2	0.5
<i>Less:</i> Other differences ²	-0.6	-1.1	-0.2	0.6	-1.8	-2.6	0.8	-3.5
Equals: BLS average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls	4.0	3.2	2.9	2.4	3.2	3.5	3.1	6.3
Addendum: BLS estimates of compensation per hour in the nonfarm business sector ³	3.6	2.8	3.7	3.9	2.0	1.6	4.1	3.5

^p Preliminary.

1. Includes BLS data on compensation and hours of nonfarm proprietors and hours worked of unpaid family workers.

2. Includes BEA use of non-BLS data and differences in detailed weighting. Annual estimates also include differences in BEA and BLS benchmark procedures; quarterly estimates also include differences in seasonal adjustment procedures.

3. These estimates differ from the BEA-derived estimates (first line) because the BLS estimates include compensation and hours of tenant-occupied housing.

NOTE: This table incorporates the annual BLS revision released in August 2003.
BLS Bureau of Labor Statistics.

Table 2. Relation of Net Exports of Goods and Services and Net Receipts of Income in the NIPAs to Balance on Goods and Services and Income in the ITAs

[Billions of dollars]

	Line	Seasonally adjusted at annual rates							
		2001	2002	2001	2002				2003
				IV	I	II	III	IV	I
Exports of goods and services and income receipts, ITAs	1	1,284.9	1,229.6	1,180.9	1,188.3	1,230.5	1,255.8	1,244.1	1,247.7
<i>Less:</i> Gold, ITAs	2	4.9	3.4	2.9	2.6	3.5	3.6	3.8	3.8

Other items	12	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
<i>Plus:</i> Gold, NIPAs	13	-3.4	-3.3	-3.3	-3.3	-3.6	-3.5	-2.9	-3.4
Adjustment for grossing of parent/affiliate interest payments	14	6.0	5.0	6.1	4.3	5.1	4.8	5.7	5.3
Adjustment for U.S. territories and Puerto Rico	15	35.6	38.0	38.6	30.1	37.2	41.1	43.4	31.9
Imputed interest paid to rest of world	16	18.3	20.1	17.8	18.6	19.8	20.6	21.3	21.5
Equals: Imports of goods and services and income payments, NIPAs	17	1,678.0	1,726.1	1,549.3	1,600.4	1,739.8	1,769.7	1,794.7	1,810.6
Balance on goods and services and income ITAs (1-9)	18	-347.2	-422.1	-294.4	-363.2	-437.3	-434.9	-452.6	-475.9
<i>Less:</i> Gold (2-10+13)	19	-2.8	-2.8	-2.8	-2.7	-3.6	-2.9	-2.0	-2.0
Statistical differences (3-11) ¹	20	-3.1	32.5	31.8	23.4	30.2	27.7	48.6	48.7
Other items (4-12)	21	0.9	0.8	0.7	0.9	1.0	0.8	0.7	0.9
<i>Plus:</i> Adjustment for U.S. territories and Puerto Rico (6-15)	22	15.1	19.3	14.7	26.5	19.4	16.6	14.8	26.1
Equals: Net exports of goods and services and net receipts of income, NIPAs (8-17)	23	-326.9	-433.2	-309.3	-358.2	-445.7	-443.8	-485.1	-497.5

1. Consists of statistical revisions in the NIPAs that have not yet been incorporated into the ITAs (2003:1) and statistical revisions in the ITAs that have not yet been incorporated into the NIPAs (2001:1-2003:1).

ITAs International transactions accounts
NIPAs National income and product accounts

Appendix B

Suggested Reading

The Bureau of Economic Analysis (BEA) has published a wealth of information about the methodologies that are used to prepare its national, industry, international, and regional accounts. In addition, most of this information is available on BEA's Web site at <www.bea.gov>. Look under "Methodologies"; for articles from the SURVEY OF CURRENT BUSINESS, look under "Publications."

National accounts

The national accounts encompass the detailed estimates in the national income and product accounts (including gross domestic product) and the estimates of wealth and related estimates.

National income and product accounts (NIPAs). This series of papers documents the conceptual framework of the NIPAs and the methodologies that have been used to prepare the estimates.

An Introduction to National Economic Accounting (1985) [also in the March 1985 SURVEY]

Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends (2002)

Foreign Transactions (1987)

GNP: An Overview of Source Data and Estimating Methods (1987)

Government Transactions (1988)

Personal Consumption Expenditures (1990)

The methodologies described in these papers have been updated and improved, typically as part of the comprehensive and annual revisions of the NIPAs. For more information, see the following.

National Income and Product Accounts of the United States, 1929-97 (2001) provides the definitions of the major NIPA aggregates and components, discusses the measures of real output and prices, explains how production is classified and how the NIPAs are presented, describes the statistical conventions that are used, and lists the principal source data and methods that are used to prepare the estimates of gross domestic product (GDP). [Go to <www.bea.gov/bea/an/nipaguid.htm>.]

The following SURVEY articles describe the upcoming comprehensive revision of the NIPAs.

"Preview of the Revised NIPA Estimates for 1997: Effects of Incorporating the 1997 Benchmark I-O Accounts

and Proposed Definitional and Statistical Changes" (January 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts: Changes in Definitions and Classifications" (June 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts: New and Redesignated Tables" (August 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts: Statistical Changes" (September 2003)

In addition, see the following articles.

"Updated Summary NIPA Methodologies" (October 2002) briefly describes the principal source data and methods used to prepare the current-dollar and real estimates of GDP.

"Annual Revision of the National Income and Product Accounts" (August 2002).

"BEA's Chain Indexes, Time Series, and Measures of Long-Term Economic Growth" (May 1997) describes the conceptual basis for the chain-type measures of real output and prices that are used in the NIPAs.

"Reliability of GDP and Related NIPA Estimates" (January 2002) evaluates the principal NIPA estimates by examining the record of revisions to them.

Wealth and related estimates. *Fixed Reproducible Tangible Wealth in the United States, 1925-94* (1999) discusses the concepts and statistical considerations that underlie the estimates and their derivation.

"Fixed Assets and Consumer Durable Goods for 1925-98" (April 2000) describes the definitional and statistical improvements that were incorporated in the comprehensive revision of the estimates.

Mission Statement and Strategic Plan

The mission statement of the Bureau of Economic Analysis and the latest update to its strategic plan for improving the accuracy, reliability, and relevance of the national, industry, regional, and international accounts are available on BEA's Web site at <www.bea.gov>; look under "About BEA."

Industry accounts

The industry accounts consist of the estimates of gross domestic product by industry, the input-output accounts, and two satellite accounts.

Gross product by industry. “Improved Estimates of Gross Product by Industry for 1947–98” (June 2000) describes the most recent comprehensive revision of these estimates.

“Gross Domestic Product by Industry for 1999–2001” (November 2002) describes the most recent annual revision of these estimates.

Input-output accounts. “Benchmark Input-Output Accounts for the U.S. Economy, 1997” (December 2002) presents the 1997 accounts and describes the improvements that were incorporated.

Satellite accounts. These accounts extend the analytical capacity of the input-output accounts by focusing on a particular aspect of economic activity.

“U.S. Transportation Satellite Accounts”

For 1992 (April 1998)

For 1996 (May 2000)

“U.S. Travel and Tourism Satellite Accounts”

For 1992 (July 1998)

For 1996 and 1997 (July 2000)

International accounts

The international accounts encompass the international transactions accounts, direct investment, and international transactions in services.

International transactions accounts (ITAs). *The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures* (1990) describes the methodologies used to prepare the estimates in the ITAs and the international investment position of the United States. These methodologies are usually updated and improved as part of the annual revisions of the ITAs.

The annual revisions of the ITAs are described in a series of articles, the latest of which is published in the July 2003 SURVEY.

Direct investment. *International Direct Investment: Studies by the Bureau of Economic Analysis* (1999) is a collection of previously published articles on U.S. direct investment abroad and foreign direct investment in the United States. It also includes the following information.

The “Methodology for U.S. Direct Investment Abroad,” which is also available in *U.S. Direct Investment Abroad: 1994 Benchmark Survey, Final Results* (1998)

“A Guide to BEA Statistics on U.S. Multinational Companies,” which is also available in the March 1995 SURVEY

“A Guide to BEA Statistics on Foreign Direct Investment in the United States,” which is also available in the February 1990 SURVEY

In addition, the updated methodology for foreign direct investment in the United States is available in *Foreign Direct Investment in the United States: Final Results From the 1997 Benchmark Survey* (2001).

International services. *U.S. International Transactions in Private Services: A Guide to the Surveys Conducted by the Bureau of Economic Analysis* (1998) describes 11 surveys. It includes classifications, definitions, release schedules, the methods used to prepare the estimates, and samples of the survey forms.

“Selected Issues in the Measurement of U.S. International Services” (June 2002) describes key issues in defining and measuring insurance, wholesale and retail trade, finance, construction, and utilities services and explores possible actions to address these issues.

Regional accounts

The regional accounts include estimates of personal income and gross state product.

Personal income. Estimates of personal income are prepared for States and for local areas.

“Comprehensive Revision of State Personal Income for 1969–99” (June 2000) summarizes the changes in the methodology that is used to prepare the estimates. The detailed methodology is available on the CD-ROM *State Personal Income, 1929–2000*.

“State Personal Income: Revised Estimates for 1999–2001” (October 2002) presents the most recent annual revision of these estimates.

“Comprehensive Revision of Local Area Personal Income for 1969–98” (July 2000) summarizes the changes in the methodology that is used to prepare the estimates for counties and metropolitan areas. The detailed methodology is available on the CD-ROM *Regional Economic Information System, 1969–2001*.

“Local Area Personal Income, 1999–2001” (May 2003) presents the most recent annual revision of these estimates.

Gross state product. “Comprehensive Revision of Gross State Product by Industry, 1977–94” (June 1997) summarizes the sources and the methods that are used to prepare the estimates. “Gross State Product by Industry, 1977–98” (October 2000) describes the most recent comprehensive revision of these estimates.

“Gross State Product by Industry, 1999–2001” (June 2003) presents the most recent annual revision of these estimates.
